33. Power on AO-7.

Yahoo group: eu-amsat
Date: 2004-06-18 08:27:28 UTC
From: John Alan Hackett.
Topic: 33 Message: 33

Hi All,
We all know about the power problem
on AO-7. What some people might not know is
that the mode-A transmitter originally only
had 2 watts. These days, almost 30 years on
the estimated output power is probably only
about 500mW.

Therefore, don't expect BBC/CNN type signal
strengths. A good 10m antenna is a *MUST*.

I work mode-A with 5w EIRP! on 20 year old
equipment so there's no excuse for...."but I
don't have the latest all singing, all dancing
Icom/Kenwood/Yaeso".....etc etc

See you on mode-A.

73 John. <la2qaa@...> <la2qaa@...>

excuse

34. AO-7 Power (was Re: [eu-amsat] Digest Number 7)

Yahoo group: eu-amsat
Date: 2004-06-18 16:18:09 UTC
From: Emily Clarke

The original power was 8W on mode B, 2W on mode C and A. My estimates are pretty close to John's in that mode B is about 2W, C is about 1W and A about 500mw.

To put this into perspective, FO-29 is a solid 1W, so B is 3db stronger than FO-29, C is about the same as FO-29 and A is 3db below. That doesn't seem like very much, so why is Mode A so hard to copy? If you compare the signal strength of modes B and A in relative terms of normal antennas we use (path loss being equal) the answer is obvious:

2M 5 Element Yagi = 9db + 3db = 12db relative
2M Vertical Ground plane = 4db + 3db = 7db relative
10M 3 Element Yagi = 6db -3db=3db relative
10M Vertical = 2db - 3db=-1db relative
10M Dipole= 0db - 3db = -3db relative

So AO-7 in mode B can be as much as 15db above mode A. That's a huge difference! Factor in that most people don't have a 10M Yagi on an AZ-EL rotator they are losing even more power.

73,

Emily

From: John Alan Hackett.
Topic: 35 Message: 35

Hi Emily,
Excellent! resume (and post) re: the AO-7 mode-A versus
mode-B power.

Great stuff.

73 John.

36. New AMSAT Website

Yahoo group: eu-amsat
Date: 2004-06-19 15:30:26 UTC
From: w0eec
Topic: 36 Message: 36

The newly updated AMSAT website will go into a public BETA test phase shortly. Before we go to "BETA", we are in an "ALPHA" stage and I would like to invite members of AMSAT-EU to participate:

http://www.amsat.org/amsat-new

Please visit the informational (help) pages at
http://www.amsat.org/amsat-new/about

These help pages will provide information on getting around the new site and how it is organized. We hope these information pages will answer most questions about the new site.

Your comments are welcome!

Please do not send comments directly to me.

Please use the Bug Report form to report bugs on a specific page, and the Contact form for non-bug related questions and comments. The a link to the Bug Report form is linked in the footer of every page, and will help us understand the problem and better prioritize the response. If you wish to share your opinions of the site with a larger audience please post to this list rather than amsat-bb since this will not being announced on the BB until the BETA phase begins.

We have two people investigating bugs and one designer/developer (me) fixing issues. We would like not to burn anyone out or overwhelm them with nits. However we are interested in uncovering and resolving as many real issues as possible.

73,

Emily

37. Mode-A antennas & bad ears ...

Yahoo group: eu-amsat
Date: 2004-06-19 21:13:36 UTC
From: SV1BSX
Topic: 37 Message: 37

Hello to the Group,

in Mode-A of OSCAR-7, I'm using a half-Windom HF antenna in order to receive the DownLink on 10m Band. Generally, I have not problem to hear any weak Downlink signal, when the satellite is "QRV" on Mode-A.

As you know, a Windom antenna did not covers the 30m Band (WARC), so I'm using an additional Quarter-wave wire Sloper, in order to cover this band on HF.
By using a change-over switch into my Shack, is possible to "switch-on" the Windom or the Sloper in the input of my receiver.

During the last orbits of AO-7 (Mode-A), I was turning randomly my antenna switch from Windom to Sloper.

Well, it's impressive that I noticed, the Sloper receives the DownLink signals 1-2 S units stronger than Windom ! (always without RF pre-amp)
I was surprised with that observation, actually a Windom antenna covers the 10m. Band, the Sloper did not (it's "cut" for 10.1 Mhz).

The 30 m. Band Sloper tested again and again, but was obvious to me, the Sloper hears much-much better than Windom the AO-7. The explenation may be is that, the 10m. Band is about the 3rd harmonic of 30 m. Band.

I posted this message for those which they have interesting about Mode-A antennas.

Keep in mind, the feedpoint of my Sloper is close to my roof (ground) and the overall length of wire is 7.3 m. The angle of my Sloper is about 45? from the vertical supporting-mast. Actually, I have used as feedpoint the lower edge, close to my roof because the surface is painted with aluminium-paint, which is excellent in order to serve as "ground" (and gives also to my building a good thermo-isolation!).
Alternative, you can make a "ground" by using several quarter-wave wires (radial). In practice, my antenna is not a "pure" Sloper, it's something like between a Sloper and a GP, but working extremely well with AO-7 !

On the other hand, you can try the normal-Sloper setup, with feedpoint on the upper edge. In this case you must use as "ground" the metallic supporting mast, but really I can't say if this setup has the same good result with my Sloper for Satellite reception.

Finally, this message is devoted to some Satellite operators with foul-ears ! Today, I was trying for 3rd time in the last 2 weeks, in order to make a QSO via AO-7 (Mode-A) with a European station (called CQ).
Once again, he don't answered me !

It's strange but, my downlink signal was "Loud and Clear" (on my DownLink receiver) AND I was in the same frequency with him !

So, I have only an explanation: HE IS absolutely "DEAF" !

CONCLUSION : it's very important in the satellite-operation to make first our receiving systems, especially the antennas.

It's unfair to transmit into the Satellite-Uplink with strong power signal, if you can not hear a weak signal in the Downlink.

For this reason I've posted this message... if you know a better antenna for AO-7/Mode-A, or you have any other suggestion, lets us to know.

Have fun with Satellites.

From: Jean-Jacques DE REY
Topic: 37 Message: 38

Thanks for the info Mak !

Your sloper seems to work vy well, I was surprised to receive 5N from you while I gave you only 55 the other day....

I believe that - because we cannot 'elevate' our 29.5 MHz antenna - the reception can be quite different from place to place. For example, on an overhead pass, my groundplane will not perform very well, while your sloper gives FB signals. It might be the opposite for low passes.

So, the ideal is off course to be able to switchover antenna's like U are doing.

Best 73s and CU on SAT!

Topic: 40 Message: 40

This post is from Hans PA0HOP.
.....

Hello John,

Just to let you know I heard you very well in cw (giving cq) mode A
via AO-7
at 11:50 UTC.
RST 559, perfect to copy on 29.452 Mc/s.
Tried to reply, however could not find my downlink signal ..., hi.
For uplink I used my old Icom IC-290E (20 years or so old) and 10
watts rf
output into a single turnstile antenna (without reflector) for 2
metres.
Downlink antenna my inverted vee 2 x 11 metres and apex at 10 metres,
fed
with 450 ohm open wire.
Next time better.
.....

Nice to know the 5w EIRP is heard.

73 John.

43. AO-7. Further to Maks.....

Yahoo group: eu-amsat
Date: 2004-06-21 11:02:52 UTC
From: John Alan Hackett.
Topic: 43 Message: 43

Hi All,
Further to Mak's post re: 10m downlink
antennas.

It must be stressed to the newcomers (and experienced
operators?) how important the receive antenna is.

There really isn't much point in transmitting to the
satellite if you can't "hear" the stations answering
your calls.

Mode-A on AO-7 is a best a weak signal mode of
communications. As Emily W0EEC previously wrote, originally,
the mode-A transmitter produced an "enormous" 2w but these
days (30 years on) that figure is probably nearer 500mW so in
fact you do! need an antenna, the "wet string" just won't
do here.

Those ex: HF operators (like myself!) who have spent the last
couple of years used to loud and clear signals on mode-B or J
must remember that the 10m downlink is susceptible to the
idiosyncracies of the ionosphere, especially in this less than
optimum part of the solar cycle. If you're having difficulty
communicating via mode-A on AO-7 the first step towards making
things better is to improve your receiving antenna.

Believe me, it *will* help.

73 John.

Hi John,

Usually means that there was another station in the passband that was very strong. When that happens here, we usually find out it is someone poaching the 2m uplink frequency with FM that you can't hear. The FM signal is too weak to be heard on 10M since it's spread out over 15khz, but the transponder still responds to the power. It has no idea if it's FM or if it's 10 CW signals.

47. Eggbeater & Turnstile antenna

Yahoo group: eu-amsat
Date: 2004-06-23 12:53:08 UTC
From: SV1BSX
Topic: 47 Message: 47

Hello EU-AMSAT s

I have read the last days, several pages on Internet about
some kinds of omni-directional antennas, for LEO's satellites.

They are 2 type of antennas, that appear to predominate for LEOs:

the "Eggbeater" & the "Turnstile".

BTW, I have not any experience with that, I'm using Yagis with
remoting EL-AZ system.
Actually, my elevation system that I used has broken for second time
(windy QTH)!
So, is very interesting for me an antenna system without EL-AZ system,
in order to cover the LEOs Sats.

Has anyone experience with the "Eggbeater" (or Turnstile) ?

I have found several descriptions, how to construct it
and few performances about the satellite reception, but it's not
clear to me if this antenna is effective for the Satellite UpLink.

Finally, can we work successfully (TX & RX over 10-15? Elevation)
the LEO satellites, just by using a VHF-Eggbeater & a UHF- Eggbeater ?

Thanks in advance

Attachments: 1 described; binary payloads are missing from this source WARC

Hello Mak,

I have no experience with eggbeater (Lindenblad) antenna, but with turnstile yes.

Turnstile is quite critical to arrange for 'clean' circular polarisation + I found that performance for low elevation is not very good.

But another antenna which I definitely recommend is the QFH (Quadrifilar Helix) - I made one for VHF and another for UHF.

They perform very well from elevation as low as 5° (you can define this by construction), exhibit a very clean circular polarisation, and offer gain (+3 ... + 6db depending on construction parameters / elevation).

Construction is very easy, not critical, materials cheap.

On my VHF model I used copper tube of 6mm, SWR was perfect (1.2) at design frequency.

On the UHF model I used as well 6mm tube (which is too much, I realised afterwards... better 3mm plain wire I think), SWR was about 2:1 on design frequency (which was however correct, but believe impedance is too low).

I use now both models for my APRS SatGate station, packets from ISS are coming in as soon as the 'bird' is 5° over horizon ...

I guess that with this antenna you can easily work SO-50 barefoot, for the ISS you might need more power (50w should be fine).

Interesting links about this antenna :

http://website.lineone.net/~askrlc/
http://www.pilotltd.net/qha.htm
http://www.jcoppens.com/ant/index.en.php (I built my both QFH with info from John's site, I believe this give the best info...)
http://www.futesta.de/projekte/ant_quadrifilarhelix.html

Feel free to contact me should you need more info, pictures how I assempbled it , etc....

Actually, my elevation system that I used has broken for second time
(windy QTH)!
So, is very interesting for me an antenna system without EL-AZ system,
in order to cover the LEOs Sats.

Has anyone experience with the "Eggbeater" (or Turnstile) ?

I have found several descriptions, how to construct it
and few performances about the satellite reception, but it's not
clear to me if this antenna is effective for the Satellite UpLink.

Finally, can we work successfully (TX & RX over 10-15° Elevation)
the LEO satellites, just by using a VHF-Eggbeater & a UHF- Eggbeater ?

Thanks in advance

..OK, thanks for answer dr J-J (ON7EQ) and also to you John (LA2QAA).

Actually, now I read all about this type of antennas (QFH, TPM etc.) before my final dicision.

J-J, your suggestion about QFH seems to be very good, your foto and the icluding URLs was very helpful. Great !

On the other hand, John's suggestion is also very attractive, because the gain that it offers the TPM is very good .

Anyway, I will try to decide... many thanks to both of you.

73, Mak SV1BSX

PS: BTW, is it known any source for a piece RG-62 for the "phasing-stub" of TPM?

Subject: Re: [eu-amsat] Eggbeater & Turnstile antenna

Hello Mak,

I have no experience with eggbeater (Lindenblad) antenna, but with turnstile yes.

Turnstile is quite critical to arrange for 'clean' circular polarisation + I found that performance for low elevation is not very good.

But another antenna which I definitely recommend is the QFH (Quadrifilar Helix) - I made one for VHF and another for UHF.

They perform very well from elevation as low as 5? (you can define this by construction), exhibit a very clean circular polarisation, and offer gain (+3 ... + 6db depending on construction parameters / elevation).

Construction is very easy, not critical, materials cheap.

On my VHF model I used copper tube of 6mm, SWR was perfect (1.2) at design frequency.

On the UHF model I used as well 6mm tube (which is too much, I realised afterwards... better 3mm plain wire I think), SWR was about 2:1 on design frequency (which was however correct, but believe impedance is too low).

I use now both models for my APRS SatGate station, packets from ISS are coming in as soon as the 'bird' is 5? over horizon ...

I guess that with this antenna you can easily work SO-50 barefoot, for the ISS you might need more power (50w should be fine).

Interesting links about this antenna :

http://website.lineone.net/~askrlc/
http://www.pilotltd.net/qha.htm
http://www.jcoppens.com/ant/index.en.php (I built my both QFH with info from John's site, I believe this give the best info...)
http://www.futesta.de/projekte/ant_quadrifilarhelix.html

Feel free to contact me should you need more info, pictures how I assempbled it , etc....

Subject: [eu-amsat] Eggbeater & Turnstile antenna

Hello EU-AMSAT s

I have read the last days, several pages on Internet about some kinds of omni-directional antennas, for LEO's satellites.

They are 2 type of antennas, that appear to predominate for LEOs:

the "Eggbeater" & the "Turnstile".

BTW, I have not any experience with that, I'm using Yagis with remoting EL-AZ system.
Actually, my elevation system that I used has broken for second time (windy QTH)!
So, is very interesting for me an antenna system without EL-AZ system, in order to cover the LEOs Sats.

Has anyone experience with the "Eggbeater" (or Turnstile) ?

I have found several descriptions, how to construct it
and few performances about the satellite reception, but it's not
clear to me if this antenna is effective for the Satellite UpLink.

Finally, can we work successfully (TX & RX over 10-15? Elevation)

Hi.

For those who think that loading keps and keeping a satellite tracking program is too much of a chore, there are alternatives.

One such online resource is G3WGM Jim Heck's online tracker. It will produce a timetable of passes for any satellite of interest. All it needs is your QTH or Lat/Long.

You can find this online tool at

www.g3wgm.org/sats/default.htm

57. MINITRAK

Yahoo group: eu-amsat
Date: 2004-07-04 15:13:20 UTC
From: Allan Copland
Topic: 57 Message: 57

Hi,

I placed a copy of my simple DOS based satellite tracker in the
Files / Useful Utilities folder.

Minitrak is a cut down version of my DIY tracker (ROTRACK) and will
do realtime tracking / magic Diamonds charts / Multi-satellite
prediction and predicted orbit data (either to screen or to an ASCII
datafile.. minitrak.eph). This data can be read by Notepad or any
other file reader.

Lastly, it has a utility named INVIEW. This makes a graph of the
amount of time a bird spends at all compas points and elevations over
a time span (usually a month). This allows those with fixed aerials
on a simple rotator to optimise their aerial elevation for a
specified bird.

It has pop-up help via the f1/f2/f3/f4 keys and takes its input from
a 2 line keps file... default is kepele.tle but this can be altered.

I also included PKUNZIP.. to unpack the archive.

make a directory c:\minitrak and copy the archive to that. Pkunzip
and you are ready to go. Please read the instructions & online help.

Have fun es 73.

From: SV1BSX
Topic: 58 Message: 58

Hi J-J

I was looking your Q?? antenna, but I can't find the dimensions for UHF-QHA.
Is it exactly the 33% of your VHF?

2. I read a comment about "Z" of this QHA, that isn't 50 Ohms but much lower...
how many Ohms is about?

3. I saw also your pictures, your QHA (loops) seems to be from the top CCW (left hand
circular) and not CW (Right hand circular)... is it the picture reversely (mirror)
or the winding of QHA is reverse ? On another page the winding was CW in a similar
antenna, so I'm a little-bit confused.

Hi Mak,

I used for dimensions the Javascript calculator at John's site :

http://www.jcoppens.com/ant/qfh/calc.en.php

Regarding L or RHCP : well I really didn't mind, as the antenna was intended to RX only the ISS.

Maybe you better ask John ON6JC john@... for advise.

Well, on my UHF version I measure at resonnance SWR of about 2:1. John believes the impedance is too low (copper pipe diameter too thick for the frequency), so probably impedance is in the region of 25 Ohm ?

I believe that heavy copper wire (3mm) should be better and .... more easy to handle than 5 mm copper tube (it was very difficult to bend this in the proper shape + weld ! The 2m version was no problem at all....).

We have been noticing the same with FO-29 here on the west coast of the US. We are experiencing a lot of QSB. However, we have also been attributing this to unlicensed poachers on the uplink frequency running very high power FM radios. This affects the AGC and the satellite fades very quickly.

73,

Emily

70. Antenna steering hardware circuit required

Yahoo group: eu-amsat
Date: 2004-08-03 18:30:06 UTC
From: hrushenka2000
Topic: 70 Message: 70

Hi all

Thanks for taking the time to read this.

I am in the process of converting an old CCTV pan and tilt unit into
a rotator/azimuth unit which I hope to use for satellite tracking.
I am looking for some circuits to interface this to allow PC control
from a tracking program for automatic antenna steering.
The unit uses 12v DC motors, and 2 feedback pots.

Does anyone have any info which would be suitable?

Thanks in advance

Jason, G7KPM

71. Re: [eu-amsat] Antenna steering hardware circuit required

Topic: 70 Message: 71

Hi Jason & EU-Amsat group,

I've constructed also a homebrew AZ-EL system with a rotator for AZ +
TVRO Actuator for EL, fully controlled from my PC with NOVA Sat tracking
program.
The unit has 2 pots for feedback, like yours.

I was looking for a simple electronic unit for a long time, and I found the
FODtrack excellent because:

1) you can make it if you have little experience in electronic
constructions.
2) you can find the diagram (and PCB **) on Internet.(it is not
"Top-Secret", like
other models!)
3)you can adapting that in every system AZ/EL.

4)supported by a perfect program for Sat-tracking, like NOVA.
5)is possible to run with the FODtrack program, if you need something very
simple, under DOS (...in your old 386, 486 etc!).
6)it is the cheaper electronic-unit for Sat-tracking.

The electronic components of FODtrack unit are usual, except one IC,
that for D/A converter, but that was rare here in Greece.
Maybe you can find it easily in UK.
It is not expensive, 5-20 $/piece, depend on the market place.

**The only problem is the PCB, which exists in the Web page. The
drawning is not very good for printout, in order to make someone the PCB.
But if you are patient, you can make it that on a general-use (multi-hole)
PCB.
On the other hand you can bought that from AMSAT-CE, for about 100 $
(if I remember correctly).

I 've drawn a new diagram and I plan to make a new PCB,
based into FODtrack software, quite simplest, for my second AZ-EL
system.

I hope my Email was helpful. If you want any additional info,
just let me know.

73, Mak SV1BSX

72. Important message for KEPS users

Yahoo group: eu-amsat
Date: 2004-08-16 07:57:13 UTC
From: Allan Copland
Topic: 72 Message: 72

Hi Pepole,

I took this message by Thomas Frey HB9SKA from another user group.
I would not normally do such things but it does have relevance for
this group.

The message could be of importance to anyone who uses keplerian
orbital elements. I rather suspect that might be all of us.

Regards,

Allan Copland.

Hello All

Please read the Important Notice of Dr. Kelso at

http://celestrak.com/NORAD/elements/notice.shtml

and fill out the form carefully.

Please forward this mail also to other forums and news groups than
those I have sent it to (see header of mail).

Thank you for your support and may be the kepler data be free !

Mit freundlichen Grüssen, Greeetings, 73

Hi Emily

I'm very-very sorry for delay to answer you but, I was very busy with
Olympic Games here.

Just now I'm relax and I found some free time to answer you.
On my Web site it's a hiden page about actuators... it is not finished yet,
but may be is useful for ideas.
Just now I have only several illustrations but very soon I'll add fotos.

Take a look and if you have any questions, just let me know.

http://www.qsl.net/sv1bsx/actuator/actuator.html

Vy 73

Mak SV1BSX

PS: I repeat, the page is under construction, so "don't shoot me" for any
possible error !

Hi to all,

...after the summertime and the holidays, are we again active with our "batteries" in full charge?
Or we have problems with our BCRs and batteries like the AO-40? Hi Hi...
I don't see any traffic here...

Anyway, I wish to all members of EU-amsat a good new season and many QSOs through the "birds".

Hello OMs,

just I wondering, why the AO-7 during the summer is active in the majority of orbits on Mode-A and the rest seasons is active mainly on Mode-B or substitutionally between Mode-A & Mode-B.

Any explanation?

81. FO-29 pass

Yahoo group: eu-amsat
Date: 2004-09-23 20:36:56 UTC
From: SV1BSX
Topic: 81 Message: 81

Hi OMs

few minutes ago, FO-29 was in good pass (orbit #40.017) for my location...
well, I had a long-long time to hear this bird too Loud & Clear !

The interesting point is that, the satellite was in eclipse from AOS for me
(over
Saudi Arabia) till Russia, close to LOS.... But always my return-downlink
signal was
excellent. That probably means, the battery is in good shape !
For the history, I'm using 25 Watts and 4 El Yagi on VHF & 6 El Yagi on
UHF.
Nothing special . (The mode is ..always CW).

I heard also a "G3O...." station, which answered to my CQ (CW) ,
but was not received the full callsign.
(Sorry my friend, may be CU agn in some future pass of FO-29).

73, Mak SV1BSX

82. FO-29 vs FM-birds

Yahoo group: eu-amsat
Date: 2004-10-01 11:40:15 UTC
From: SV1BSX
Topic: 82 Message: 82

Hi OMs,

as I said few days ago, I'm watching the last period the FO-29.
Almost every morning I'm listening in the DownLink and if the pass
is good for my location, I will call CQ (on CW).

Well I'm surprised with that, but NOBODY IS THERE !
The "bird" is always lonely and I wondering why that.
The FO-29 the last month was in very good shape, the
Downlink signal is good enough and I hear it with
a simple antenna system.

My surprise was bigger during the last 2-3 days, when I monitored
the ISS FM-voice repeater. The traffic is great, like a "pile up"
on HF ! And I wondering, why the ISS has traffic and the FO-29
not !

It's only my personal opinion but, I think the ISS FM-repeater
(& AO-51) it is not the better way for a satelliter. Only two stations
have the opportunity for a QSO under Contest's condition (59-QRA-73)
in contrast with FO-29 and other satellites with linear transponders,
which allows several QSOs simultaneously without problem.

Keep in mind, these mornings I'm not in my QTH which I have
the appropriate antenna with Elevator etc. I'm in alternative location
(2nd QTH) and I use a 4 El. Yagi for VHF and 6 El for UHF without
Elevation !

It's funny but, easily I've access into FO-29 and almost NEVER in
the AO-51... the ISS depend on the orbit but I tried 3-4 times to
speak with that and the traffic was incredible. So, I'm not sure
if the ISS is easy or difficult compared with FO-29.

But I'm 100% sure, FO-29 is always accessible with my simple
antenna.... always my Downlink-return signal comes to my ears, easily,
just by using 5 Watts (QRP !) for UpLink.

Really I can not explain why they working the FM-birds, with limitations,
and not the FO-29 which has additional capabilities, like
bandwidth, several modes, easier access, multi QSOs in the same time,etc.

I wondering... is it a new kind of "masochism" that ?

If you have a different explanation, let me know.

83. RE: [eu-amsat] FO-29 vs FM-birds

Yahoo group: eu-amsat
Date: 2004-10-03 20:13:24 UTC
From: William Leijenaar
Topic: 82 Message: 83

It's very easy, for FM sats you only need a simple portabe or FM set that almost everyone has.
For FO-29 you need SSB transceivers, and also one that can do full-duplex, with doppler correction etc etc... just to difficult for most satellite (?) hams...

I put a question mark because I think the endless calling FM satellite hams I see as none-satellite hams. They are just dx-ers, and they don't care about ham rules or technology, they only count in qsl-cards...

Its the same endless conversation I have with local HF hams. They tell me satellite contacts are none real contacts. To easy they say. In my opinion HF is much more easy than satellite. They all have rigs ready bought, even wire-antennas bought, and have even no idea what is going on inside the radio. The only thing they count is qsl-cards... not technology...

Unfortunatly the younger generation is a very small group. Components getting very expensive, or they are not available (the old style transistors..), or you need special equipment for newer (SMD) components to do your first radio experiments...
Buying a fo-29 station is not easy for these few beginners, so what is left are the "old" group that has worked fo-29 so many times that they are not interrested any more in this satellite.

I think this trend will go on. I would better see a information broadcast satellite, with 1200 PSK downlink, or the even in CW, or the old RTTY. The information must be from all clubs in the world, with contest information, awards etc etc... This makes the whole ham community interrested, and they will do their best to get an ssb rx, or decoder :o) And also listeners can be made interrested, and finally maybe be satellite-ham... And thats what we need, new fresh minded satellite hams...

84. Re: AO-7 / Mode-A

Yahoo group: eu-amsat
Date: 2004-10-06 15:00:33 UTC
From: Allan Copland
Topic: 79 Message: 84

Hi Mak,

You said..
> just I wondering, why the AO-7 during the summer is active in the
> majority of orbits on Mode-A and the rest seasons is active mainly
on
> Mode-B or substitutionally between Mode-A & Mode-B.
> Any explanation?
>
> 73, Mak SV1BSX

Well, your seasons are not the same as the satellite's 'seasons' but
here is one possible explanation for the effect.

The mode switching could be thermal, caused by varying internal
temperatures (caused by varying degrees of solar heating), in the
mode switching electronics.

A-O-7's electronics are way past their 'sell by' date and have
suffered massive doses of cosmic radiation, so its is hardly
surprising that they are flaky.

If the bird is still sending telemetry with any decent frames (frames
ending in 650 or 651) you could try decoding the internal
temperatures.

My best guess, and it is only a guess, is that the effect is likely
due to cyclic thermal variations. Only the telemetry (if you can
decode any good frames) can tell.

Kind Regards,

Allan Copland

Hello Makis,

I recently purchased at very reasonable QSJ a couple of Agilent HEMT ATF10136 devices on E-bay... I can give you the contact if I find back details (the OM probably has more).

See specs attached in pdf format. This is a very good device (DB6NT uses same in his products ...)

No time yet to build the preamplifier ...

Best 73s and CU on SAT !

..OK J-J, tks for answer !

Actually you have right, the ATF10136 seems much better against to the other GasFet s.
The datasheet gives the best NF around 20-30 mA and that means a much better Dynamic
range.

Well, about your LNA construction, don't delay it !

I'm surprised with that... the difference "with" and "without" LNA is spectacular .
For example, the FO-29 receiving now is too Loud and too Clear, as never before !

Unfortunately, the usual mistake during the final setup with change-over coaxial
relays (PTT without changing on relays !), destroyed my GasFet.

The GaFet LowNoiseAntenna pre-amp is not extremely difficult constructions.
It is more a mechanic than an electronic construction, there is not need for special PCB etc.

Personally I followed the JH0WJF design. You can find it here:
http://bun.dokidoki.ne.jp/earth-moon-earth/photo/jh0wjf/preamp/index.html

The diagram it's on DL5LF's site:
http://www.qsl.net/dl5lf/432_preamp.html

Another simple circuit for the "old" MGF1302:
http://www.df9cy.de/df9cy_432lna.html

73 & CU on Sats!

Thanks for the nice links Mak and info ! This stimulates my appetite to warm up the soldering iron ...

Watch out with these ATF devices, they give soo much gain at low frequencies that gain must be artifically reduced to keep them stable. Anyhow, the better the input circuit (highest Q factor), the better you will match the noise floor of device, what happens thereafter is off less importance.

Some other links which might interest you ...

http://hjem.get2net.dk/ole_nykjaer/oz2oe/atf54143/54143.html

Nice mechanic construction (idea?) : http://www.hb9bbd.ch/photo.php3?photo_id=324

Next to making QSO's over the birds, have been busy recently with reception of WX-Sats (the NOAA's).

It is fascinating what you can get with very simple antenna and receiver ...!

More info (and online weather maps) on my site http://wxsat.shacknet.nu

73s and see you on FO29, still a great bird !

>thereafter is off less importance.

...Yes, that is 100% correct.

The main problem with GasFet is the self-oscillation but, there are some
"Tips"
in order to prevent that.
Unfortunately, there is not any comments about this very important point,
into Web-pages which describe these constructions.

From my experience, the "tips" are the following:

1) small Ferrite Bead through Drain's leg. This FB is not the usual FB801,
but
something smaller. It helps to prevent effectively the unwanted
self-oscillations.

2) the "Drain" load resistor must be a "pure carbon" resistor. (metal film
is prohibite!)

3) 1st operation:
the pre-amp should be supplied from a power supply with "Current-Limiter"
for maximum current-flow upto 15 mA.
Thus, if you have any unwanted self-oscillation, the circuit is protected
against
any damage from high-currents.

4) Adjustable resistor in the "Source" of GasFet. (220Ohm preset pot).
(Set the preset for Maximum resistor before supplied the GasFet !)

The current of GasFet must be controlled smoothly & easily from 2 - 15mA
with
that preset.
*If NO and the current is stable, you have "self-oscillation" !
*If YES adjust the current, for example up to 10mA and measure the resistor
of preset.
(10 mA for best NF of FHX35 .... for ATF10136 is 25 mA as PDF describes)

Then, replace the preset with a usual carbon resistor, which has the same
value
of preset after the adjustment.

5)Voltage stabiliser:
I don't agree with JH0WJF's method for GasFet supplying (7805 and 2 serial diodes in order to reduce the output, from 5 V to about 3.7 V).

I destroyed a GasFet with this method during the current's measurement. Actually, the circuit with 2 diodes needs enough current-flow, in order to reduce
the voltage. On the other hand, it is not stable the VF (voltage forward) across a diode,
that depend on the current through diode and generally that is between 0.5 - 0.7 Volts
(for each diode.)
If the current is too LOW, the 2 diodes reduce the voltage only 1V (2x0.5). Thus, the GasFet supplied with 5 V - 1V = 4 Volts, and actually this value is equal
to highest operating Voltage of FXH35LG !

I can say that: GasFet is very-very sensitive with Voltage Supply.
Any mistake is disaster for these.

On the other hand, I agree with DL9YC's supply-method. He uses just a Zener diode...
quite simple and stable voltage supplying. By using 3,3 V or 3,6 V/1W Zener, you have
accurate Voltage supplying for 20 mA Load, easily.

Finally, do not supply the GasFet with maximum operating voltage.
I believe the 3-3,3 V supplying is enough, because the Gain on 435 MHZ is too high and there is not necessity for a higher Voltage value, which is dangerous for these sensitive components.

Have a nice weekend.

Topic: 90 Message: 91

Hi Mak,

thanks for compliment, you should have called me HI !

For AO-7 it is very important to adjust your power level (on the IC-910H this is very easy, I modified the software settings so I can go down to 1 watt). As soon as you use too much power, the signal gets distorted (you have strong FM 'warbling' because solar panels cannot handle the output). So the maximal settings is about 3db before the 'warbling'. I hear a lot of stations going beyond this point and it is a pity ....

Sometimes 1 - 10 watt out is OK (I would say in 70% of time), sometimes I have to use full power 80w (in general at end of pass).

Uplink antenna's are in general 4x 17 ele horizontal polarisation tonna's (about 21db gain), or when 1 watt on this array is even too much then I switch to 10 watts on the 10 ele yagi (which I also use for low orbit sats like ISS etc).

You can see picture of my setup on www.on7eq.com

96. AO-51 Digi-mode Query

Yahoo group: eu-amsat
Date: 2005-01-03 17:01:50 UTC
From: SV1BSX
Topic: 96 Message: 96

Hello to Group & Happy New Yaer,

for first time, the last day of 2004 I tried to listen the AO-51
on Packet mode (9600).
Well, my effort was successful about receiving and I copied
about 4 min. continuously the DownLink of AO-51.
In practice it was very easy.

Because I have no experience in something like that, I wondering
how is possible to "connect" into AO-51 BBS...
OK, the RX-DATA from Downlink-UHF-RX is connected into TNC...
no problem here.

But how the UpLink RIG is connected ?
The TX-DATA (+ PTT) should be connected to the Uplink Transmitter
by using the same TNC?

I think, I'm not sure for that, if the DCD led on TNC is "on",
the TNC can not transmit.

Actually, the DownLink of AO-51 is always open, always it has a
carrier, so the DCD led was always "on" during my reception.

Has anyone on the Group any experience with Satellite Digi-mode?

Is it possible to connect two separate RIGs for UpLink-DownLinks with
the same TNC or Am I wrong?

73, Mak SV1BSX

97. OD on AO-7

Yahoo group: eu-amsat
Date: 2005-01-10 18:22:19 UTC
From: SV1BSX
Topic: 97 Message: 97

Hi to all,

today I worked the OD5RI via AO-7/Mode-B SSB (orbit #37991).
It's a "new-one" for me on SATs and I believe that it's a rare prefix for
many
Europeans, so just "watch" the SATs if you want him.
He is active from time to time the last period.

I had heard him also on AO-51 during the first "QRP exper. day", but our
QSO was
not completed. He could not hear my last letter of my suffix
(I had said "XXXX-rrrrrrr-aaaaa-yyyyyy" about.... 20 times without success
!)
while I heard my return-signal "Loud & Clear" on the downlink... anyway!

Also today afternoon the same story with my last letter, but finally he
"caught" me !
Alleluia !

So, just keep in mind that... the "good ear" is not the advantage of him !

Congrats Mak, nice DX !

I worked him on AO-27 on 08/1, so he seems quite active on all sats !

100. ISS's QSL cards

Yahoo group: eu-amsat
Date: 2005-01-12 20:19:21 UTC
From: SV1BSX
Topic: 100 Message: 100

Hi again to all,

well, I wondering about the QSL cards for QSOs via ISS on voice or packet.

Especially if we have a QSO on Packet via ISS, is it correct
to write 59 ? Actually the receiving is not direct but through
a spacecraft... also in Voice, I think it's unreal if the "A" station
gives to "B" station a signal report, if both using the ISS as
repeater (just my opinion).

I would like to read you comments about.

Hi J-J,

tks for answer... actually today afternoon, during #38430 orbit of AO-7
I heard my return signal on Mode-B, so the bird is OK.
But I noticed that, the transponder activated over the Northern part of
Europe with some
delay, because the satellite was out of Eclipse much earlier.
No traffic recorded.

Hi David.

I'm not too far away here in Paisley. The satellite scene is somewhat quiet at the moment but some interesting things are on the horizon.

One is VUSAT(AKA hamsat) an Indian built linear transponder satellite due for launch sometime soon.

Kind Regards,
Al.

Hi Al, and the rest of the group,

I'm just getting back into ham radio after a lengthy period of inactivity, and am really fascinated by the idea of working the satellites. So, far, I have been listening to the AO-51 passes on a Yupiteru MVT-7100 handheld receiver (just using the set-top whip). I'm planning to build a handheld yagi to boost the downlink receive capability. I do have an Alinco DJ-G5 (which needs a new battery-pack), so I would like to have a go at the FM sats with that in time.

I have applied to join AMSAT-UK, and in the meantime am just learning what I can about satellite operation and listening to the passes while pointing telescopic whips at weird angles!

I have installed the latest version of PocketSat Plus on my Palm PDA, and that seems to work very well indeed.

BTW, in case anybody knows me under my other callsign - I was originally GM7VZV when I was first licensed as a Class B. Then, on passing the Morse Test I was allocated MM0AOF. I never did like that call much, (it was very often mis-copied on voice) so, when the recent changes in licensing came through I re-activated GM7VZV as my main callsign.

Hi David and welcome to the group,

about the handheld Yagi and if you looking for a homebrew construction, I
suggest you the XE1MEX's antenna-project:

http://xe1mex.gq.nu/antenas/yagi.html

I've tested with handheld V-U and works pretty fine. The improving is far
away
from any whip, vertical etc.

About the FM-birds, keep in mind also the SO-50. I had several QSOs the
last
3 months through this bird, it's in very good shape. (needs 67Hz subtone).

AO-27 is workable also, but may be you have limitation from Scotland,
because
this bird is "ON" till the north part of Europe.

Hope to CU on Sats.

Another simple and useful design for the 2M band is at http://home.att.net/~jleggio/projects/rdf/tape_bm.htm

This is based on plastic electrical conduit and material from a tape measure. It's ideal for LEO's and will double for hill-topping while being capable of being rolled up and stored inside a larger piece of plastic tube. It uses a simple wire hairpin feed.

If you wish to 'roll your own' antennas, I can strongly recommend that you download a copy of YAGIMAX, a yagi modelling tool that is simple to use.

Regards,

Al.

108. Yagimax.

Hi,

For budding antenna designers I'd suggest Yagimax.

You can find it in the SIMTEL archive at

http://www.simtel.net/product.php%5Bid%5D46509%5Bsekid%5D0%5BSiteID%5Dsimtel.net

Hi Folks,

Thanks for the welcome and the suggestions for homebrewing handheld yagis. I think the Tape Measure Yagi is the best approach for me - portability and compactness will be important. I guess I will be making a Saturday trip to B&Q for antenna bits!

I did download YAGIMAX, but I can't figure how to run a DOS program on Windows XP.

>
> 73 de David (GM7VZV)

David,

the simplest way is:

Create a FOLDER with a name i.e. "Yagimax" into your hard disk C
(C:\Yagimax)

Put all the files of Yagimax-program into this directory.

Go inside this folder and looking for the YM311.exe
(I have the version 3.11, so the "exe" file is "YM311.exe"
In case which your program is a different version, probably the "exe" file
has similar name, like YM324.exe, if your version is 3.24).

"Click" to high-light this file.... after that, put the arrow of mouse over
the file... by using the mouse - with right-button of it always pressed,
"drag" the file out of folder, into your
desktop-surface.

Now, when the button of mouse relieved, a small window will appear into
your screen. Choose on it "Create Shortcut here".
Thus, a new-shortcut for Yagimax will create into your Desktop.

I'm running the Yagimax on XP-platform without problem... by "clicking"
the YM-shortcut, the XP opens a dummy-Dos window including the Yagimax
Dos program.

BTW, the Yagimax is a good program for Yagi's calculation, but it will be
supposed we know some basic principles in the antenna theory, so that we
give in the program correct parameters for calculation. Otherwise, the
result is.... rubbish!

I hope this Email was helpful to you.

Have a nice weekend

From: riri
Topic: 114 Message: 114

Hi Mak
Thank you for inviting me to this nice group well my handle is Riri
i'm 45 years old my call sign is OD5RI my coutry is Lebanon my city
is Baabdat locate about 20 km east of the capital of Beirut at 785
meters above sea level and my grad locator is KM73UV.
Hope to hear all the fellows on the birds.

Hello Riri,
glad to see you along the members of EU-Amsat group!

I've sent my QSL card direct to you on 17.01.2005 with SAE+.
Hope you've got that and I am very awaiting for your QSL card!!!

See you via satellites again!

...very interesting news, tks to John & Allan for the update!

BTW, I can't find more details about this Satellite.

I read for a height of about 600 Km above the earth in the online
newspaper,
so this seems like to a LEO and not to a HEO satellite.
I wondering also about the sat-mode (Mode-B ?) of it .

Thanks in advance

73, Mak SV1BSX

Topic: 123 Message: 123

Hello Mak,
I thought the news might wake a few people up hi,
that's why I deliberately kept it "short and sweet".

EU-Amsat being the first place I put the news.

You're correct in your assumption about the satellite, it's an LEO
with a mode-B linear transponder,
(you know how Al and I feel about Amsat and their FM satellites) It
was built by a friend of ours, William PE1REA. A very clever young
man. William first contacted us many years ago when he was still a
student with his "ideas". Al kept in daily contact while William was
travelling around the world.

You do know I suppose that Al is a lifetime member of Amsat India?.
(We were dissatisfied with Amsat-UK and Amsat-NA's "all eggs in one
basket" policy.) We would have preferred to see a fleet of RS-type
satellites aimed at newcomers rather than this FM junk. Al reckoned
that in the future it would be Amsat India that would be the place to
be. he was right.....but then he always is!.

I remember you had your doubts about EU Amsat Mak.....don't!, you'll
see.

73 John.

124. Preparation.

Yahoo group: eu-amsat

From: John Alan Hackett.
Topic: 124 Message: 124

My Lords, Ladies, Gentlemen (and GM1SXX),
As you are all now
aware, VUsat (or Hamsat if you will) is "imminent".
Therefore, it's time to start "preparing".....so what say
we all start blowing the dust off the mode-B equipment and
revitalise the operating skills on AO-7.

As well all know, AO-7 has no batteries and relies solely on the sun
panels. This in effect means it will start FM'ing if you "hit" it
with too much power so please bear in mind that you should QRP if
you've just come off FO-29. An EIRP of 10 watts is adequate for CW
and 30 will "see you right" on SSB. When the satellite is near CA
(closest approach) you can half that.

Naturally we are all aware (or should! be) of the idiosyncracies of
the ionosphere so please don't shoot the messenger if your 10 watts
doesn't cut it on a particular day. The point?.....please don't use
any more power than is necessary for reliable communinications on
AO-7. If you follow J.J's advice you won't go far wrong.

73 John. <la2qaa@...>

Topic: 125 Message: 125

PS.

For those not aware of it, the following link will take you to an activity log for AO-7.

<http://www.emilyshouse.com/experthams/ao7/ao7log.php>

Here, if you browse around a bit you'll find "everything" you need to know about AO-7.

If you make a mistake while using the log don't worry about it, I usually edit things about once a week.

Remember, logging on can be useful to other operators, they can then see who's doing what, to whom, and when.

128. I have posted some pictures

Yahoo group: eu-amsat
Date: 2005-03-05 16:29:43 UTC
From: pe1rah
Topic: 128 Message: 128

Hi AMSATs,

Now the launch of the HAMSAT is comming closer and closer I decided to post some pictures of the satellite.

I posted also pictures of a 2m to 20m downconverter design for hams that have only HF ssb available in their shack.
The design is made as simple and cheap as possible. This has been done to help the hams in countries where "modern" electronics are not easy available or extreem expensive.

For those who want to use this converter they must not expect the best results at all. First of all it has to be put into a metal box to shield it from unwanted RF signals. The 2m input filter is made simple, without trimmers for tuning. The tuning has to be done by making the coil slightly larger or smaller. (this to avoid trimmers that might be expensive or exotic in some countries)

For those who can spend more: The receiption on 2m can be improved with a low noise rx amplifier in front. Easier ways (and in some situation even cheaper) are the use of a high gain YAGI antenna.
The construction of a yagi antenna can be made extreem simple and cheap. When I have some more time I will post some ideas of making cheap yagi antennas.

73 and lets hope HAMSAT will work well, and it can help in the next disaster wherever on earth...

PE1RAH, William

Hi William.

I read that it will not be too long (April) until the launch of VuSAT/HAMSAT. Good news indeed and a big boost for the linear transponder satellite scene.

Hope you are well,

Kind Regards,

Allan Copland

Hi Dave,

Welcome to the AMSAT-EU group.

I see you live in Irvine, not far from me in Paisley.

We are hoping to have a new linear transponder bird in April...
VuSAT/HAMSAT, built in India and carrying a Dutch built transponder.
I believe the satellite is in Thermovac testing right now and due for
launch if all goes well in April this year.

If you are planning to attend this Magnum rally this year, I hope to
meet you there.

Hi Al

Many thanks for welcome to AMSAT - EU group. Yes I live in the Girdle Toll part of Irvine and work in Paisley for the Railway. I have been licensed since Nov 02 (MM3XPG to 2M0XPG and now as MM0XPG) although I have been interested in Amateur radio for the last 25 years.

Presently I am a HF only operator on all bands btw 20 - 10 mtrs and have a mini beam on a tennamast in my back garden. However I have become particularly fascinated by the satellites.
So far I have the ARRL Complete Satellite Handbook which my wife bought be after passing my advanced exam. I am reading through it and that is as far as I have got.

I am hoping to set up in time a Satellite station for analogue modes and am contemplating a FT736 ? or FT847 ? and trying to work out a reasonable antenna array to start. Like most Amateur related specialisations when you are new, it is difficult to know where to start and you can go off on a spending spree and leave your bank account in tatters, hihi.

I certainly would welcome any advice you may be able to offer in getting started on Satellites
as I have no experience and little knowledge in the subject.

I hope to be at the Magnum Rally in May so certainly look forward to meeting you there (or maybe before that if you happen to be down in Irvine.)

73 Dave
MM0XPG.

133. AO-7 was Re: [eu-amsat] Digest Number 48

Yahoo group: eu-amsat
Date: 2005-03-21 18:08:59 UTC
From: Emily Clarke
Topic: 133 Message: 133

I have been following this thread with interest, and thought I should pass along some information (and speculation) to the group. There is no definitive rules about AO-7's behavior but from what I have observed and have received unofficial confirmation, when AO-7 comes out of eclipse it reacts to it's bus voltage in a fairly systematic manner.

When it first comes out of eclipse (ie - it thinks it was just launched) and it appears the mode of choice is Mode B. Why? The answer is simple - it is the highest power mode (8 watts.) If the voltage is low or drops, it will switch to Mode C, which is a low power (2W) version of mode B. If the voltage remains low or drops, it will switch bands to Mode A (1W) and finally goes into Mode D (off). Most operators can't distinguish between modes B and C - though they will comment on "Satellite sounds noisy today" when in fact the link margins are lower. So most hams will say that it was in B or A, and never consider it may be in C.

What triggers these, and why do they seem somewhat random?

There is basically a lot of debate but I believe there are two factors. The first is QRM. The proliferation of illegal 2m transmitters particularly in the southern hemisphere that are poaching into the satellite sub band is causing AO-7 fits. Most of these are FM, wide band (compared to SSB/CW) and can really pull down the bus voltage. The second is timing - if AO-7 doesn't get out of eclipse cleanly things start to go wrong.

Here is a scenario that I have worked out - it mostly pertains to North America but I'm sure similar conditions exist in Europe. I've talked to two of the original members of the AO-7 team and although the member who did the mode switching logic is SK they seemed to believe this is pretty close.

AO-7 comes out of eclipse on the ascending orbit. In the winter, this happens as far north as 55 degrees N where there is little QRM. It comes on in Mode B while it is still "shadowed" by the earth's atmosphere, so the amount of current the solar panels generate is less than optimum. Therefore the first 30 seconds are critical and set the stage for the rest of the orbit. If someone is already hammering it with a CW signal, it's likely to drop down to Mode C, otherwise it stays in Mode B. As it gets into full (unobstructed) sunlight the amount of current increases and it becomes more immune to low voltage conditions. But the mode has been set and never goes from lower to higher power.

As we move from winter to spring, the point at which AO-7 comes out of eclipse moves farther south. This means that Mexico and Central America move deeper into the footprint when AO-7 is turned on. This also means QRM in the form of FM has more of a chance to come into the passband during the

critical 30 second period. If it does, the satellite will downgrade its mode. If it doesn't, we get lucky and it stays in mode B.

But even at this point AO-7 is not out of trouble. If too much QRM or too many hams hit it with high power it will start to FM, and if that continues for a long time it will switch modes. This I have witnessed first hand - a strong CW signal can cause it to drop to mode C. Some stations with inadequate receive antennas have commented that it "turned off" because they can't hear it, but in fact it dropped it's power or switched from C to A.

Over the entire orbit AO-7 is basically navigating through a mine field that can pull down the voltage at any time. This is why I believe we see more Mode A conditions as we move towards summer (at least here in the US). By the time AO-7 hits the northern hemisphere, it has passed over some pretty hostile conditions in the third world while it was turned on.

Unfortunately we don't really know much about AO-7's WOD but it would be interesting to have data on what mode AO-7 was in just before it went into eclipse (in the southern hemisphere) to see how well it did.

73,

Emily

Hi,

Unfortunately it is highly unlikely that you will get enough good data from this bird to make a meaningful 'diagnosis'.

John LA2QAA and myself took quite a bit of telemetry from A-O-7 on the christmas period before last. Much of the data transmitted was garbage and of the frames that made sense (ending in 650/651) the data actually looked pretty nominal. The temperatures and voltages seemed fine, which sort of surprised us somewhat. I had a detailed and interesting discussion with Jan W3GEY about the bird at that time. I also talked with Pat Gowen G3IOR who has sadly now left the satellite scene for other things.

I don't believe the bird starts up in any particular mode. From what we were seeing at the time it was pretty random. Its fairly obvious that most of the telemetry system works but the power supply problems mean that it doesn't transmit many useful data frames.

Have you considered the effect of 70 Cms band OTH RADARS on the bird? That was a subject of interest for us at the time we were collecting data. AO7 does have RADAR filtering but it was designed for RADARS with fairly different PRF's (pulse repetition frequencies) from those in use today. It is likely that modern BMEWS and other RADAR's are getting in and causing receiver desense and FM'ing.

We noticed that as it climbed North the signal level was dropping every time it was headed for Europe.

On its path over Europe, the US and Russia in particular, it flies through the path of many BMEWS and other RADAR installations with ERP's in the tens of megawatts.

I found the study of the AO7 telemetry fascinating but we eventually gave up on it because of the sheer difficulty of proving anything of value from the small data sets.

(You can 'prove' just about anything you like with a small enough sample :-)).

As a result, I can't say with any sort of certainty that the RADARs are responsible for the problems.

For the same reason, it is unlikely that any definitive assessment can be made of the behaviour of AO7's transponder switching.

It should be remembered that AO7 has had the sort of radiation dose that should kill all the CMOS chips on board many times over if the manufacturer's maximum dose data are to be believed.. even given the screening employed on the bird.

Regards,
Allan Copland

Hi Emily, Allan and Group,

I noticed few days ago the following effect:

AO-7 was in Mode-B, the downlink signals was booming.
As usual happens, somebody (Alligator) was tuned with extremely high power in the middle
of bandpass and the Satellite suddenly closed (OFF, reset).

Randomly, I had my receiver still open and after about 1 minute, the Satellite
turned-on again in Mode-B and not in Mode-C, because the signals was once again "booming".
I can recognise the difference between Mode-B & Mode-C because the
Downlink signal in Mode-C is much more weaker in my receiver.
Actually I'm using just a 3 El Yagi for VHF Downlink, so the
difference is easily detectable. If the Mode-B is "ON" my receiver's
Noise-level (FMing) spectacular increasing around 145.950 during the AO-7's orbits.
This does not happen in Mode-C.
So I believe that, the logic attendance between the Modes (B,C,A) is
pretty random , otherwise after the "OFF" in Mode-B it might be "ON" in
Mode-C. That does not happen.

I remember also a similar reset few months ago... the Bird was in Mode-B
and after a short brake, came back again very weaker (in the same orbit-over Europe).
Probably that was the "Mode-C".

So, I agree with Allan at this point.... the train between the Modes seems to be
random.

BTW during the last days its in very good shape, AO-7's receiver
is extremely sensitive ! Yesterday morning was possible
to listen my return signal "Clear" in Mode-B, just by using 1 Watt
Uplink-power !

73, Mak SV1BSX

Topic: 136 Message: 136

Hello to Group,

Amsat-India's Web-page has the first pre-launch 2line-Keplerians for HamSat, but
probably the elements have a problem.

My Sat-tracking program indicates the following message:
"Data does not appear to be a valid Keplerian element file".

I tried to recover the data by using a Text Editor, without success.
Has anybody the correct data? they would be a lot of interest if we could see
the orbit of new satellite.

Hi Mak,

The Amsat-India webpage hasn't been changed for a long long time (something like 2 years).
The information and pictures on this webpage are old and not valide anymore.

Best is to wait for ISRO information, as they are the one that give relayable information.

At the end of April I will go to see the launch of HAMSAT in India.
I will try to get the up-to-date pre-launch keplers from ISRO, when they will give it free to public.
When I have them I will post them via AMSAT-BB and here on the group.

My kind regards,

William Leijenaar
PE1RAH, designer of the Dutch transponder on HAMSAT.

From: Allan Copland
Topic: 139 Message: 139

Hi,

For anyone having problems with the provisional keps on the AMSAT-India website, try the files\gm1sxx folder.

I've placed a hand tweaked set of keps based on the AMSAT-India website data. It works for me in my own simple tracking program Minitrack.

Admittedly Minitrack does NOT perform a CRC check on the data.

Hope it helps.

Regards,
Al.

140. Provisional keps... more.

From: Allan Copland
Topic: 140 Message: 140

Hi,

As always, preliminary keps are rarely meaningful. Don't expect these to work after launch, which of course is still a bit away. They most certainly won't be accurate.

You can however use them as a model for what to expect from HAMSAT in terms of the typical behaviour of a satellite in this type of orbit.

.... tks Allan for uploaded file.

Well, once again I tried to load that in NOVA without success, but your comment about CRC-check it was very useful!

So, I had also on my PC the old but famous IT (ver. 1.0Vb). After the Kepl's conversion in a new Kepls format, by using the "2l2itk.exe", the IT accepted the converted file for HAMSAT and works pretty good!

Unfortunately, I had a bad idea to load again these "converted Kepls" in to NOVA. This program corrupted (!!) after that and it was necessary to "re-install" it, in order to make NOVA workable again.
So, keep in mind that, if somebody has the same thought with me - don't try it in NOVA.

Finally, Minitrack & IT are 2 workable programs for Hamsat's orbits, with this moment available data.

147. AO-27 pass

Yahoo group: eu-amsat
Date: 2005-04-15 16:01:31 UTC
From: SV1BSX
Topic: 147 Message: 147

Hello to Group,

I believed that the AO-27 was "Off", but today afternoon randomly I heard the AO-27's pass, between 14.40-14.45 UTC.
The satellite was "ON" with very strong DownLink signal, rising to 9 S units, transmitted telemetry.
It sounds like packet 1200 Bps... has anybody experience how is possible to decode these
data?

This may seem a bit obvious, but I'd suggest taping the audio and
using a standard TNC to attempt to decode the data.
You just never know!

Makis,

Here is some information for you re AO27. You can read more at the URL listed.

Best 73
Al.

www.umbrasi.com/AO27/tlm.shtml

Logging AO-27 Telemetry

We need your help in logging TLM from AO27. While we condition the batteries we can use your help in receiving TLM from the satellite. If you have a 1200 AFSK TNC that you can connect to your satelite receiver, you have all the hardware you need.

To receive that data in a format we can use, follow these steps:
Download AO27TLM Version 1.1 (This is a newer version than on AMSAT.ORG)
Connect your TNC and verify that you can receive normal packet
Put your TNC into kiss mode (This is done with a terminal program. AO27TLM will not put the tnc into kiss mode. Many TNCs will use the commands kiss on, restart)
Make sure your clock on the computer is set correctly
Run AO27TLM with the /OT command line option (this is the only type of data we can use. If you log to kiss, or try to use some other program to log the data, we can't use it)
When the pass is over, exit AO27TLM
E-mail the resulting file (xxxxxxxx.LOG) to data@... (if you send it to any other address, our processing software will not receive it and it will be lost>

The Whole Orbit Data channel definitions are contained in a file called EYEWOD. This file is updated anytime the channels that are saved as wod on AO-27 are changed. Below is a link to the current channels so AO27TLM will extract the correct channels. This file is not needed to log data. It is only used if you would like to post process the data and look at the WOD your self.

The Current, Version 17 (0x11) EYEWOD file for AO27TLM.

150. Re: [eu-amsat] Re: AO-27 pass

From: SV1BSX
Topic: 147 Message: 150

..OK All, tks for info.

Actually, today afternoon I recorded the AO-27 pass, once again
the DownLink telemetry was "Loud & Clear" for about 4-5 minutes.
I tried to read the recorded audio file with my usual packet program and I
had
100% success reading. I can read the headers clearly in ASCII, but the
telemetry-frames
are still encoded.

Next step: I will download the AO27TLM and I will try with it.

Thanks again!

Hi Mak.

You said..
> I can read the headers clearly in ASCII, but the
> telemetry-frames
> are still encoded.

This is entirely normal. You need the software to decode the individual data channels and verify it.

I'm more familiar with the old UoSATs.. used to take a LOT of telemetry from them.
They transmit an ID header block followed by two lines of hexadecimal data. I eventually wrote my own decode software for it.

Have fun!

152. Pre Launch Meet 24 April 2005 (news de VU2POP)

Yahoo group: eu-amsat
Date: 2005-04-20 14:22:12 UTC
From: Allan Copland
Topic: 152 Message: 152

Date: Wed, 20 Apr 2005 12:01:16 -0000
From: "vu2pop" <vu2pop@...>
Subject: Pre Launch Meet 24 April 2005

Hi All
As we eagerly await the HAMSAT launch scheduled for first week of May 2005, its time we met for eyeball meet to discuss the various points related to pre launch and post launch activities of AMSAT INDIA.
In this regard we invite you to kindly attend the Amsat India meeting on 24 April 2005 time 10 AM, venue VU2POP 's QTH.
A R PRATHAP KUMAR
#18, Binny Layout II Stage,
4th Cross, 9th Main
Vijayanagar
Bangalore 560040
INDIA
Mob 94483 32249
Fax / Tel 91 80 23388073

Agenda for the meet
1. Report of the User meet held at ISRO on 9 April 2005 and related pointers at that meet.

2. Prelaunch activities like , visit to launch site or mission centre, Workshop to help build and setup ground stns viz antennas / rigs for hams.
3. Post Launch activities like, felicitate the Chairman, Centre Dir, Program Dir, Project Dir and associated members of ISRO for the success of Hamsat.
4. Visit to ISTRAC to see the command or mission centre activities.
5. Plan well for the next series of HAMSAT as proposed by the Chairman.
6. VU2BGS to provide his bench model transponder for bemch test reports and proceed to build the flight model.
7. Raise funds by way of donations from among members in VU and DX for the future series of transponders for HAMSAT series.
Also the members can sponsor or fund the difficult to get critical components from different sources.
8. Anyone having any working innovative ideas or designs for the next series for HAMSAT may submit to AMSAT INDIA which will be forwarded to ISRO by the technical committee.
9. Open discussions related to Amsat India with the permossion of the chair.
10. Lastly we request all annual members to upgrade to life membership as it has been found that most annual members dues have not been renewed . And the Tres finds it embarassing to keep

reminding such members.
We wish to follow other Amsat orgs in Dx which have only life members and ofcourse donations to raise funds for certain projects.
NOTE All are requested to kindly adhere to the above agenda for discussion and not deviate out of topic.

So see you all for an eyeball at my QTH.

153. FO-29 traffic

Yahoo group: eu-amsat
Date: 2005-04-25 22:42:23 UTC
From: SV1BSX
Topic: 153 Message: 153

Hi friends,

well, today afternoon during FO-29 pass (about 18.45 UTC), I was impressed
with traffic on this bird ! I was looking for a clear frequency on the
middle of Passband for CQ, but that was impossible....
several stations was QRV on CW & SSB !

Bird's "warble"! Its spring season !

I don't know if that is something temporary, but is very nice to hear
again the usually "lonely" bird with too much traffic.

I hear also new callsigns and that is great. I don't know if that is
important,
but the last period I'm looking into DX Cluster and several times I have
seen several spots for FO-29.

Sometimes, I put my self few DX-spots. Actually, I don't like very much
this method,
but if that helps and supports the Bird's traffic, no problem, I
love it !

BTW I'm still looking for "JP" grid square... is anybody there ?

Bye and I hope to CU soon on FO-29.

Hi Terry,

>
> Hi Mak, it shure was busy. I called you but you were popular with QSOs.See
> you soon T erry G1WPR.

well, I have a small problem on Satellite access from High buildings, when
the Bird's orbit is "SouthWest-West" of my QTH. I have good access when the
Bird moves from Central to North Europe & Scandinavia (bearing for you
between 120 to 20?), so just looking for me at these orbits.
I'm usually on the middle of Passband (?435.850) and I'm calling CQ mainly
on CW and sometimes on SSB.

CU on FO-29.

156. Latest Indian HAMSAT satellite information

Yahoo group: eu-amsat
Date: 2005-04-28 19:09:02 UTC
From: pe1rah
Topic: 156 Message: 156

Hi AMSATs,

As many of you know, the launch of the Indian HAMSAT is comming closer. We still have to wait a while but not to long.

In 2 days I will leaving to India to see the launch of HAMSAT with my transponder on it. From my last contact with ISRO I can tell that HAMSAT is doing great, and that it is already mounted on the rocket. In the next few days the rocket will be transported to the launch place, where it finally will be launched on the 5th of May.

After the launch HAMSAT will first be checked by the ISRO ground station. A few days after the launch one of the transponders will be activated for the ham users. When all goes well I think this will be in the weekend of 7/8 May. It might be not due to some (technical) reasons, but it gives you a good reason to fix up your antennas and listen for the new HAMSAT bird :)

I will be in India at that time, without any rig. It would be nice to hear signal reports from the HAMSAT up/dwnlink. at any place of the world.

Lets hope that all goes well and that HAMSAT will be fine for a long time,

HAMSAT frequencies:

Indian transponder:
Uplink : 435.225MHz to 435.275MHz LSB/CW
Downlink: 145.875MHz to 145.925MHz USB/CW
Beacom : 145.940MHz continue carier signal

Dutch transponder:
Uplink : 435.225MHz to 435.275MHz LSB/CW
Downlink: 145.875MHz to 145.925MHz USB/CW
Beacon : 145.860MHz 12WPM with CW message

From: SV1BSX
Topic: 159 Message: 159

Hello,

the last period I noticed that, several stations call me near to my LOS!
Sorry but, I can't answering... sometimes I did that and usually the QSO
was uncompleted.

So, please take a look if the other station has enough time for your call,
depending upon the satellite's access of him.

Just keep in mind, when the satellite is overhead for you,
may be is close to LOS for the other station. Greece is in
South-East part of Europe and when a satellite is over SW-West-NW of
Europe, usually that happens with stations from EA,CT,G,GM etc.
I will do my best for a QSO with all of you, but please keep in mind my
LOS time.

Thanks in advance.

Countdown for Cartosat launch begins
Press Trust of India
Bangalore, May 3, 2005

The countdown began early on Tuesday morning for the launch of India's
latest remote sensing satellite CARTOSAT-1 along with a piggyback
satellite, HAMSAT, on board the Polar Satellite

Launch Vehicle (PSLV-C6) from Satish Dhawan Space Centre at
Sriharikota in Andhra Pradesh, on Wednesday.

The launch is scheduled between 10.19 am and 10.40 am.

"The countdown began early this morning," an ISRO spokesman said.
The 1560-kg CARTOSAT-1 along with 42.5kg HAMSAT would be launched from
the newly set up second launching pad.

CARTOSAT-1, 11th satellite in the Indian Remote Sensing series, is
intended for cartographic applications and is expected to give a
further fillip to remote services by providing imagery with improved
spatial resolution.

The data from CARTOSAT-1 is for providing enhanced inputs for large
scale mapping applications and newer applications in the urban and
rural development, land and water management, disaster assessment,
relief planning and various other GIS applications.

HAMSAT is a microsatellite for providing satellite based Amateur Radio
to the national as well as international community of Amateur Radio
(HAMs).

PSLV launch with two satellites on May 5

Special Correspondent

Four-stage vehicle will put 1,560-kg CARTOSAT and HAMSAT in space

PSLV has been built by Vikram Sarabhai Space Centre
First launch from brand new second launch pad at Sriharikota
Countdown begins on May 3

CHENNAI: The Polar Satellite Launch Vehicle (PSLV) carrying two satellites will lift off from the spaceport at Sriharikota on May 5 and the launch campaign for the mission is in full swing, according to K. Narayana, Director, Satish Dhawan Space Centre, Sriharikota, Andhra Pradesh.

The four-stage vehicle is already mated with two satellites ☐ CARTOSAT and HAMSAT.

What is significant about this mission is that this is the first time that a launch vehicle will blast off from the newly-built, sophisticated second launch pad at Sriharikota, about 100 km from here.

The four stages of the PSLV have been vertically integrated on a huge platform in a massive, tall building called the Vehicle Assembly Building. The PSLV was wheeled slowly on its launch platform on a rail track to the launch pad on Saturday. "We have already assembled the rocket with the satellites in the Vehicle Assembly Building. We are planning the launch for May 5," Mr. Narayana said.

He said the countdown would start on May 3, that is 52 hours before the launch. The Mission Readiness Team, which consists of experts, would review the health of the launch vehicle, the two satellites and the ground stations and make its recommendations. Based on these, the Launch Authorisation Board would give the clearance for the start of the countdown.

The PSLV has been built by the Vikram Sarabhai Space Centre, Thiruvananthapuram, which is the lead centre of the Indian Space Research Organisation (ISRO).

Both CARTOSAT and HAMSAT have been fabricated by the ISRO Satellite Centre, Bangalore.

CARTOSAT, which weighs about 1,560 kg, will be useful in preparing atlases, monitoring the growth of cities, laying ring roads and so on.

The 43-kg HAMSAT is a mini-satellite that will provide amateur services to HAMS (amateur radio operators).

It has two transponders □ one designed in India and, the other, by a Dutch amateur radio operator from the Higher Technical Institute, Venlo, the Netherlands.

Information Courtesy www.ddinews.com (Science & Technology pages)
Thursday 05 May, 2005.

PSLV-C6 lifts off Sriharikota

ISRO's Polar Satellite Launch Vehicle PSLV-C6, carrying India's 1560 kg remote sensing satellite CARTOSAT-1 and a 42.5 kg micro satellite HAMSAT, blasted off from the Satish Dhawan Space Centre at Sriharikota.

It was launched from the new state-of-the-art Second Launch Pad, built at a cost of Rs.400 crore. This will be the first launch from this pad.

The PSLV-C6, in its ninth flight, soared into the sky from the newly set up state-of-the-art Second Launch Pad at the space centre.

President A P J Abdul Kalam, who had dedicated the launch pad to the nation yesterday, watched the launch.

This is the first launch from the second launch pad which had come up at a cost of Rs 400 crore. This is the first time ISRO is launching two satellites in one mission.

CARTOSAT-1, Rs.250 crore project of ISRO, will be used for cartographic applications and the HAMSAT for amateur radio operator services.

The PSLV-C6, the 295 tonnes and 44.4 metres tall workhorse launch vehicle of ISRO, lifted off at 10.14 a.m. It will place the satellites into a 618 kms Polar Sun Synchronous Orbit (SSO).

The launch vehicle consisted of a core stage with 138 tonnes of solid propellant and six strap-on motors, each carrying nine tonnes of solid propellant in the first stage, 41.5 tonnes of liquid propellant in the second stage, 7.6 tonnes of solid propellant in the third stage and a twin engine configuration with 2.5 tonnes of liquid propellant in the fourth stage.

Built for a mission life of five years, the CARTOSAT-1 is mainly intended for cartographic applications.

****
HAMSAT is a microsatellite for providing satellite-based Amateur Radio Services to the national as well as the international community of Amateur Radio Operators (HAMs).
****

Once commissioned, CARTOSAT-1 will give further fillip to remote sensing services by providing imagery with improved spatial resolution.

Yahoo group: eu-amsat
Date: 2005-05-05 12:49:36 UTC
From: pe1rah
Topic: 169 Message: 169

Hi AMSATs,

I am just back from Shriharikota launch platform, and I can happily inform you that the launch was a 100% success.

All 4 stages ignited and seperated as planed, and the satellite is in the planned orbit now.

The latest information I have is that HAMSAT is in top condition and that it spins at 1.5RPM. This will be increased to 4RPM, and shortly after that the main transponder might be switched on.

When the HAMSAT is released for ham use the ISRO will open a webpage with the latest status and kepler data. When I know more I will inform you as soon as possible... just be patience :)

Tommorrow I leaving to Bangalore where is the ISRO groundstation. There I will listen to the signals given from the transponder, and I hope all will be well.

175. HAMSAT Keplers

Yahoo group: eu-amsat
Date: 2005-05-06 08:55:35 UTC
From: Allan Copland
Topic: 175 Message: 175

Hi,

I've had emails from a few people asking why kepler elements they have found or been sent for HAMSAT dont agree with each other.

The quick anwswer to that is that ALL the kepler elements around right now are 'guesstimations' not based on accurate RADAR data.

They will serve to show users what the orbit looks like but should not be considered to be accurate in any way.

When the NORAD (North American Air Defence) RADARs get more fixes on HAMSAT as it flies through their RADAR fans, the elements will be refined and released onto the internet.

The best sources to find accurate 'measured' elements on are Celestrack or Space-Track.

I'd suggest users check out the Celestrack site as a first port of call.

I hope this helps a few people understand why the numbers dont agree with each other.

Kind Regards,
Allan Copland
GM1SXX

176. Hamsat Keplers

Yahoo group: eu-amsat
Date: 2005-05-06 10:10:32 UTC
From: Allan Copland
Topic: 176 Message: 176

Hi,

I have posted three element sets as a single file in the \Files\GM1SXX folder.

The first set is of unknown origin and was sent to me today by John, LA2QAA.

The second and third set of elements were taken directly from Celestrack at 10:00UTC and are extremely likely to be those of HAMSAT and CARTOSAT-1.

You will note that they are tagged as 'Unknown'.
This means that the people at NORAD have not yet positively identified both objects although there is little doubt as to what they are.
The main problem is in determiniming which object is which.

The data will be refined over the next few days so keep checking celestrack every once in a while for updates. Please do not expect this element set to be very accurate. It will need updating as new data comes in.

177. HamSat report

Yahoo group: eu-amsat
Date: 2005-05-06 20:12:00 UTC
From: SV1BSX
Topic: 177 Message: 177

Hi friends,

well, tonight I tried for first time a TX-test with HamSat.

This Bird is fantastic ! Super sensitive receiver! Excellent audio in DownLink !

The Orbit was #23, Max Elevation 15?, pass over Russia, Siberia to North Pole, E-NE of my location.

Just notice that, my Final UHF Stage is still damaged, so I have only 10 Watts Output Power by driver unit.
My Coaxial is about 40m and has a total loss about 5Db with connectors and Coax-relays. Antenna gain only 7dBd, so my ERP is 10 W * 2 dB= ? 16 Watts.)
But, this Power was enough ! My return signal in Downlink was clear 559 (CW), stable, even when the antenna did not follow the satellite ! (manual operation -> Auto-tracking-"OFF".

(Compared to the AO-7, this power is not enough for AO-7 accessing. Sometimes only with very good passes this Power is enough for limiting access, but in any case my DownLink signal is very-very weak.)

I sent few "CQ de SV1BSX" on HamSat, just for test, without response from somebody.
Few KHz up, I noticed 2-3 QSOs, around 145.900, with 9 S units signal.

No time for Beacon listening.

Once again, CONGRATULATIONS to William PE1RAH and Amsat-India.

Topic: 178 Message: 178

GM my friends,

well, few minutes ago I made my first QSO via HamSat (orbit #31) with
HA8AR.
I sent to him a real 599, he gave me 579, excellent receiving report for my
15 Watts ERP ! I think, this Bird is ideal for... QRP satellite operation !
Before our QSO, HA8AR had a QSO with Gena, ES1RF.
Of course in CW mode !
But, the satellite surprised me again: was possible to received this Bird,
just by using my old GP antenna ! 59 on my 2x4El cross, 55 peaking to 57
with GP !!!

Impressive !

Have a nice weekend (with this Bird, I'm sure for that!)

179. Who name HAMSAT to VO-52 ???

Yahoo group: eu-amsat
Date: 2005-05-12 12:00:30 UTC
From: pe1rah
Topic: 179 Message: 179

Hi AMSATs,

I am trying to find out who gave HAMSAT the name VO-52 ???
Anybody knows ???

Its name should be HO-52, and the real developers of the HAMSAT also want it to be like this. Somehow someone else got interfered again and gave it its nickname "VUSAT" instead of the real name HAMSAT as it is named by ISRO and the real developers.

For some Indian hams they nickname it VUSAT, but to the world it should be HAMSAT. When its stays VUSAT I want my radio to be PE-SAT, with number PE-52 (as it is none VU radio) :o)

ISRO is the maker and funder of the HAMSAT (except the Dutch transponder). I would like it to be fair to accept their name of the satellite which is HAMSAT.
Therefor please change the VO-52 into HO-52.

I ask your help, as I can not do to much here in India right now.
At the moment talks are going for maybe a HAMSAT-II. A good behavior and respect toward ISRO would be helpfull. I even extend my flight back to The Netherlands for promoting a future satellite...
How I have to explain them that HAMSAT is called VO ??

73,
VU2/PE1RAH
William (Developer of the Dutch transponder)

Topic: 181 Message: 181

Hello Folks,
I want to go on record as saying the following.....

I absolutely agree with William, PE1RAH.

ISRO are wholly responsible for HAMSAT and we should respect their designation for this satellite.

William is responsible for the Dutch transponder and not only deserves the thanks of the amateur satellite community but should also have the privilage of naming his transponder in any way he chooses.

No matter that Amsat-NA have taken it upon themselves to "give it an OSCAR number".....to the best of my knowledge, Amsat-NA had absolutely nothing! to do with the planning and implimentation of this satellite.

HAMSAT is a very suitable designation, lets keep it.

183. FM on linear transponders.

Yahoo group: eu-amsat
Date: 2005-05-12 19:43:40 UTC
From: John Alan Hackett.
Topic: 183 Message: 183

Hello All,
Re: HAMSAT. After reading several postings from various
BB's around the world it became clear that not everyone is aware of
the inefficiency of FM on a linear transponder.

What the newcomer *needs* to know is that it depletes the batteries
far! more than CW or SSB. The reason FM was included on HAMSAT was
soley for the purpose of those operators that *don't* have access to
CW or SSB equipment.

I hope the experienced operators will set an example and refrain
from using FM.....while at the same time, encourage the lesser
experienced operators to use the far more efficient modes of CW and
SSB.

It is also not necessary to deplete the batteries by using more
power than is needed for efficient communications.

I's in our own interest that we in EU-AMSAT set an example for
efficient operating.....which will of course prolong the life of
HAMSAT.

Hi,

There is an interesting article on HAMSAT in OutlookIndia.

This details the Indian Space Reasearch Organisation's kind gift to
the global amateur radio community and Willian Gerard Leijenaar
PE1RAH's
personal contribution to Hamsat.

Hi Andrew,

Welcome to the AMSAT-EU group.
We hope you find the group of interest.

The most recent development in the amateur satellite scene has been the launch of Hamsat just over a week ago from the Sriharikota test range (SHAR) in India on a PSLV rocket as a secondary payload alongside India's Cartosat-1 spacecraft.
The new bird is working fine and you can find some photos and transponder information on this site and elsewhere on the Internet.

>Anybody knows ???

OSCAR designations is a copyrighted process that was started by Project OSCAR (of which I am vice-president) and in 1969 Project OSCAR legally transferred this authority to AMSAT as a governing body. OSCAR numbers can only be given out by AMSAT, and there is a formal procedure to apply for an OSCAR number. The procedure is well documented and posted in the FAQ section of the AMSAT website:
http://www.amsat.org/amsat-new/information/faqs/numbers.php

The request must be made by an organization (in this case AMSAT-India). Individuals involved in building a satellite are not considered to have standing nor are people who contribute money, regardless of the amount. Only the organization can ask for an OSCAR number, and only an organization can suggest it's OSCAR designator prefix. Individual components (ie, a transponder) are not given numbers - only satellites are given OSCAR numbers (even if the amateur portion of the satellite is a secondary payload.)

Before I posted the name VO-52 to the AMSAT website I verified the authority of the messages and assignment.

73,

Emily

Hi Emily,

I see you made one little mistake.
When reading number 4 of the OSCAR procedure:

4) After the above requirements have been met, the organization or organizations which are the builders/owners of the spacecraft must request that AMSAT-NA assign a consecutive OSCAR number to the spacecraft as follows:

This is not AMSAT-India.
The builder and owner of HAMSAT is ISRO (India Space Research Organisation)
I can not imagine that they will name the HAMSAT "VO-52"

On Monday I will check this with the ISRO chairman and ask him to do the official procedure.
I know there are many misunderstandings in the world about HAMSAT, and I only try to get them right, and keep those bad willing hams out of it.

My kind regards
73,
PE1RAH

[Note: What I post here is not any official AMSAT statement. It is only my personal feelings about the matter of William's concern.]

While you may have been working with ISRO, it is not clear here in the US if they were contracted, if they are simply the launch services provider or if they are the builder/owner of record. I doubt that AMSAT will want to get embroiled in any internal political debate in India, especially one of a long historical nature.

Here is what I know. The request was made by the person who is the head of the organization recognized by AMSAT as our Indian partner. That recognition was made last year by the President of AMSAT in a formal meeting. I was surprised as anyone that the satellite was commissioned so quickly after launch and I was also surprised the OSCAR designation came so quickly. So knowing the history of this project, before I posted anything on the web I questioned everything and double-checked the facts. I went farther and asked "Are you sure?" When I was assured the information was correct only then did I make the appropriate changes.

I don't want to dismiss your concerns lightly, but in this particular matter neither you nor I have any authority. If ISRO wants to protest by all means they should. Although I personally feel it is highly unlikely that AMSAT would change an OSCAR number, I suppose anything is possible.

One other note of caution that you should consider. While you may think there are only two possibilities (keep it or change it) there is a third possibility you should consider. If the satellite is owned and operated by ISRO, which as I understand it is a state run commercial enterprise, there is also a possibility that if the number is challenged it could be recalled while a more thorough investigation is held. So be careful what you wish for - it may not have the outcome you expect.

73,

Emily

Hi,

Perhaps Emily may wish to read some of the Indian Newspapers which covered the launch of HAMSAT.

Since Hamsat is an Indian satellite, built, paid for and launched by ISRO, I doubt if it matters a great deal what AMSAT HQ wishes to call it so long as the ITU is satisfied. At the end of the day, ISRO and William Leijenaar have done a grand job on this bird and we should all be thankful that at last we have a useful linear LEO although personally I'd prefer UP / 10 down, just like the good old days of the RS birds.

A 2UP / 10 down linear transponder bird might be a more appropriate technology for the developing world who of course have many radio amateurs who lack the money and resources to use 70Cms/2m transponders. Perhaps AMSAT might wish to consider the needs of the developing world a little more when planning some of their future projects.

Hi Larry.

My understanding is that the bird is only intended for CW/SSB use. FM makes extremely inefficient use of a linear transponder.

I note that many sites providing information for HAMSAT have revised their statements to CW/SSB only.

FM is a lousy mode for satellite use thanks to capture effect. Whoever has the biggest signal 'wins' the transponder. This of course encourages operating practices contrary to those needed for good operation on linear transponders. By contrast, a linear transponder can support many concurrent mixed SSB/CW users and is a far more efficient use of resources.

I hope that helps you.

Hi Larry,

keep in mind, for good satellite operation you need a "Full-Duplex" Rig.
As probably you know, on satellites you can transmit in the Uplink and the
same time
you can receive the DownLink. This is the best technique, in order to
control the Doppler-shift into your return signal into the DownLink.

As I know these Rigs, like 706, they have not "Full duplex"
Cross-Band capabilities between VHF-UHF or UHF-VHF.
It's more comfortable a second-hand RIG, like a Mobile All-Mode VHF
(or UHF) transceiver (or receiver) in co operation with your 706, in order
to cover the Mode-B for HamSat & AO-7 with UHF-Uplink & VHF-DownLink
and Mode-J for FO-29, with VHF-Uplink & UHF-DownLink. This setup you will
cover you also for the next HEO satellite P3Express (coming soon, into
2006).

This way, you have independent RIGs for your UpLink and Downlink,
so it's possible for example to transmit with your 706 in Uplink and
simultaneously you can listen the Downlink with the 2nd Rig
(and vice versa).

It's just my opinion that, but if you sell the 706MK2 and buy a new 706MK2G
your problem will not be solved. Unless you have both radios, ie the 706 MK2
for the Uplink and the 706MK2G for Downlink ! I
t's a possibility if you love it so much the 706 (hi)!

Hope that helps.

73, Mak SV1BSX

Thanks Mark for the info on the dual radios. My plan at the moment is to keep the Icom 706mk2 and in the near future when I get the other icom 706mk2g is to combine em the way that you mentioned. One for receive and the other for transmit. I have one dual type radio and its a little bit older rig. A Yaesu FT5200 similar to the 8800 and others has both frequencies displayed on the front at the same time which is good for the FM satellites and others. We have very few repeaters in the philippines so it spent most of its time on the local group which is PARA.
Will look into the plans for up grade soon.

197. Dutch Transponder..... for telemetry?

Yahoo group: eu-amsat
Date: 2005-05-17 15:10:31 UTC
From: Allan Copland
Topic: 197 Message: 197

Hi,

Does anyone know what the Dutch CW on HAMSAT sends? I have not copied it yet.
Perhaps it sends telemetry and I have missed an announcement.
It would be interesting to know.

Topic: 197 Message: 198

Hi Al and Group,

I was looking also for infos about Dutch Beacon, William (PE1RAH)
on his web-page wrote :
"CW pre-programmed message beacon on 145.860MHz. (~20mW)"
Just this info about CW message with 12 WPM, without more details.
But the "pre-programmed" refers to a "standard message", in any case
it is not the Telemetry output. I didn't found nothing more .

I wondering also about Telemetry, because we don't know anything about it,
but I
believe that probably it would be already "ON". I can't imagine a new
satellite
without telemetry.

So, if you take a look on electronic block-diagram which is published by
Amsat-India,
it's a "TM transmitter" between "Bus Electronic" and "VHF Hybrid coupler".
If the "TM" means TeleMetry, is obvious that the TM-Tx is independent from
both transponders.
Surely is into VHF, because the TM-tx output is going to VHF-coupler. In
any case
it would be very interesting to know the TX-frequency of telemetry emitter.

73, Mak SV1BSX

It may well be the case that HAMSAT in common with some other birds only has the telemetry downlink enabled when in range of the control stations.

I'd surmise that this would mean switching from the Indian to the Dutch transponder then commanding the bird into a telemetry sending mode.

The Surrey built UoSAT2 does this at times. The normal computer generated downlink stops while data are uploaded to and downloaded from the bird as it overflies the command station. Admittedly UoSAT is somewhat different in that it sends telemetry more or less continually but the same sort of techniquie could be in use with HAMSAT.

The builders would need to know the battery charge state, power consumption and probably also the temperatures onboard.

Incidentally, I've been trying without success to find out more about the CPU used on board HAMSAT. Can any of the other members enlighten me about that?

Topic: 200 Message: 200

Thanks for allowing me to join.

I have a FT-60R (2m and 70cm) that i can set up odd split and a omnidirectionial antenna. The other day i set the satellites frequencies up in a memory bank and let the HT continusoully scan that bank and go off when some satellites where close. I picked up some satellites and the ISS. The guys beside me had those arrow antennas and were firguring out times, azmuth and altitute. My HT would go off a minute or two before they could find one. All I did was set in my lounge chair and let my HT and omnidirectional antenna do the work...LOL It got to the point the Arrow guys would wait for mine to go off and ask me what frequency it went off and then pulled out there equipment.

My questions are:

What satellites can i pick up using a 2m and 70cm HT?

Can I pick up SSB and LSB with my FT-60R?

Is there a cheap way to convert the 2401.200 FM voice down of the AO-51 to my 2m/70cm HT?

Thanks so much....

Bill

Hi Bill,

Welcome to the AMSAT-EU reflector. I hope you enjoy working the birds.

In answer to your questions..
> What satellites can i pick up using a 2m and 70cm HT?

Well, a good place to start is
www.amsat.org/amsat-new/satellites/status.php

There you will find detailed information on the status of the amateur satellites and also the modes used. It is a good port of call before monitoring for any particular birds because satellites are occasionally switched off or suffer CPU crashes, so its always good to check. The frequencies for the uplinks and downlinks of all the birds are listed there.

> Can I pick up SSB and LSB with my FT-60R?
The short answer to that I'm afraid is no, you cant. It's a plain FM set.

For various reasons, not least poor operating practices and the well known 'capture effect' where the strongest signal prevails, FM is a downright lousy mode of choice for satellite transponders. Still, for those with a handy that can operate cross-band duplex, it does offer limited scope to try satellite working.
With amateur satellites you transmit and receive simultaneously on two different bands. 70Cms up and 2M down for instance in the case of HAMSAT.

You also have to take doppler shift into account when working via satellites with linear (CW/SSB) transponders but that is beyond the scope of this email.

You do NOT have to spend huge sums of money to work satellites.
Second hand amateur gear can be very useful here. I have a yaesu FT290 (with a MUTEK front end fitted) and an FT790 which feed modest linears in my attic space.
My radios are now very old and there are better multimode radios available second hand for reasonable cost.

The antennas I use , a pair of very modest ZL special yagis (Moonraker UK) are mounted on a small rotator and pitched upward at 15 degrees elevation. They are ordinary linearly polarised yagis.
They are just mounted on a simple wooden cross beam. Modest, yes, but they work. My linears are a pair of EBay specials for 2M and 70Cms

bands and the larger of the two is rated at 30watts.

The biggest mistake made by beginners (and some seasoned operators) is the use of excessive uplink power. Make sure your receive system is adequate for the job. If you cant hear em, you cant work em!

You will find many references to circular polarisation (CP) in satellite books. Over the years I've tried a variety of CP antennas and have always gone back to using ordinary linearly polarised ones. The benefits of CP are greatly exaggerated IMHO. A satellite signal can ONLY be true CP down the boresight of the antenna. At ALL other angles (and thats almost all the time!), it is NOT CP, ergo my use of ordinary antennas.

I also have a small home made slim-jim (made from some 450R feeder stuffed into a piece of sink waste) on a small bracket on the outside wall of the shack. With this I can easily copy the downlink from the new HAMSAT bird at excellent strength.

You dont need large expensive installations to work most birds.

Please have a look at K5OE's website (websearch for K5OE).
Jerry has developed some interesting methods for working from restricted locations.

> Is there a cheap way to convert the 2401.200 FM voice down of the AO-51 to my 2m/70cm HT?
>
Well, yes, if you are handy with electronic gear, you can modify and old 2.8Ghz cable TV LNB to operate on 2400Mhz. Often you can get away with simply swapping the local oscillator xtal for a new one.
Drake and other makes of converters can be tweaked for 2400Mhz satelliye downlinks. Just take GREAT care never to TX into them though!
Try david G0MRF's website and also a search for Drake 2880.

I hope this helps answer some of your queries.

Kind Regards,
Al.

Thanks,

I am not handy at electronics or putting things together. Is there a system put together that I can purchase at a decent price for the 2401 to 2m / 70 cm conversion?

I use the 70cm omidirectioinal antenna (SQ-432) for 29.95 at http://ku4ab.com/_wsn/page2.html

It picks up and transmits two meter surprising well too, hit distance 2m repeater extreamly well...I just put it in a tree....only 4" by 8" . I could mount it on my head. lol

204. Hamsat confusion.

Yahoo group: eu-amsat
Date: 2005-05-20 15:14:56 UTC
From: Allan Copland
Topic: 204 Message: 204

Some confusion seems to exists regarding the person or group responsible for the HAMSAT satellite.

Since the IARU are the agency responsible for the frequency co-ordination and clearance process for new satellites, the reader is advised to check the following webpage for cleared satellite projects including HAMSAT.

www.amsat.org.uk/iaru/finished_detail.asp?serial=30

Hi,

The HAMSAT gives only telemetry to the ISRO groundstation on none ham frequencies.
ISRO use it to check the status and to switch on/off the transponders and change attitude when needed.

The telemetry will only be activated by ISRO groundstation and is not for public use.
The frequencies are secret and only for ISRO.

From: William Leijenaar
Topic: 197 Message: 208

Hi,

About my beacon: Its pre-pogrammed.
What it sends ??? When you know CW you can decode it :P

Telemetry from my transponder ???
No telemetry from any of both transponders... propably some wrong statement again from hams that claim to be invloved in the HAMSAT project but actually didn't.

Hi Bill, could I suggest you read some of the introductory material on the AMSAT-NA website.
Try http://www.amsat.org/amsat/features/ymzintro.html

Your handie is not suitable for satellite work because none of the satellites transmit and receiver in the same frequency band.

If you plan to upgrade for satellite operation, I'd advide you to read everything you can about satellites and especially on good operating practices. The AMSAT-NA and many other AMSAT websites have a wealth of information for the necomer. There are also a number of good publications available from the AMSAT store.

Kind Regards,
Allan Copland

I have that document. Tons of those birds are dead meat..LOL

They should update it every few months or bi yearly...

Thanks

I agree Bill. It would be nice to have 100% up-to-date information at all times. Do you want to take on the job? Its thankless and you won't get paid for your efforts.
You can contact AMSAT via their web site if you feel that you could help. Please remember that the people who write these things do it in their own time and do not get paid for the privilege.

Irrespective of the fact that some material is out of date, it does not detract from its usefulness to the beginner. The techniques and operating procedures are still valid for many other birds.

You *can* however find an up to date satellite status list at..

http://www.amsat.org/amsat-new/satellites/status.php

212. MAR 31570 CPU

Yahoo group: eu-amsat
Date: 2005-05-23 20:21:32 UTC
From: Allan Copland
Topic: 212 Message: 212

Hi,

Since the launch of HAMSAT I've been trying to find out more about the MAR 31570 CPU use on board. It turns out that the Mars-Express spacecraft uses the same model of CPU. Its not at all common and appears to be a radiation hardened (RAD-HARD) CPU made by GEC for space applications.

You can see more of how the CPU is connected within the spacecraft in the \photos\PE1RAH folder where I placed William's drawing of the onboard systems. As you will all no doubt know by now, the satellite uses commercial uplinks and downlinks outside the amateur radio bands to handle command and control which of course explains why we have not heard any telemetry data from this particular bird.

It may be disappointimg for some (myself included) not to have any telemetry to analyse but at least we now know why.

214. This Afternoon

Yahoo group: eu-amsat
Date: 2005-05-24 15:30:59 UTC
From: Bill N
Topic: 214 Message: 214

I am programming my HT for for odd split pairs toniught for ECHO.

Downlink / Uplink

436.310 145.920 PL-67 AOS
436.305 145.920 PL-67
436.300 145.920 PL-67 Mid Pass
436.295 145.920 PL-67
436.290 145.920 PL-67 LOS

Not sure of how you handle the doppler shifts with PL-Tones for the uplink. If above the correct odd split or below. Or am I showing ignorance again...LOL

436.310 145.915 PL-67 AOS
436.305 145.920 PL-67
436.300 145.920 PL-67 Mid Pass
436.295 145.920 PL-67
436.290 145.925 PL-67 LOS

Thanks

Bill

HiBill,

I've never worked Echo but it looks sensible to me.
Best of luck with your setup.

Incidentally, you dont say what sort of antenna you are using but have you looked at the Arrow satellite antenna? Its basically a dual band hand held yagi made specially for satellite work.

Regards,
Al.

I use the 70cm omidirectioinal antenna (SQ-432) for 29.95 at
http://ku4ab.com/_wsn/page2.html

A few weeks back when i with Arrow guys my antenna picked up the signals and was loulder.
It is a 70cm, but picked up 2m just as good...I put it in a tree, 4 x 7 inches...

Bill,

I don't know if your typeset on keyboard is wrong or you have read wrong frequencies, but the DownLink of AO-51 is 435.300 ?Doppler AND NOT 436.300 !!!

About the "step", it's OK your programming.
If you want something more flexible, I suggest you a combination of both examples:

435.310 145.915 PL-67 AOS
435.310 145.920 PL-67
435.305 145.920 PL-67
435.300 145.920 PL-67 Mid Pass
435.295 145.920 PL-67
435.290 145.920 PL-67
435.290 145.925 PL-67 LOS

..that because, it is necessary the ?5KHz Doppler-shift in the VHF-UPLINK, just the
first (& last) 1-2 minutes, very close to AOS & LOS. I noticed that, when the satellite
is higher than 10-15?, I have access on it with stable tuning Uplink (145.920 MHz).

Finally, keep in mind, AO-51 is not always active on V-U Mode. These days is
QRV on V/S mode (Uplink VHF - DownLink S-band 2.4 GHZ).
The V/U-Mode will be open again between May 26-31, 2005 (for details take a look on "AO-51's schedule page" of Amsat-NA).

Wish you good QSOs via AO-51.

73, Mak SV1BSX

222. cheap antennas for 1.3 & 2.4Ghz

Yahoo group: eu-amsat
Date: 2005-05-25 07:16:36 UTC
From: Allan Copland
Topic: 222 Message: 222

Hi,

There are a multitude of simple 2.4Ghz DIY antenna designs out there.
Try http://qdg.sorbs.net/qdgant.htm
The same is true of antennae for the 1.3Ghz band.
Thick walled white PVC pipe makes a good support structure for helicals.
Rather than use wire (can be difficult to work with) I've had some
success with self-adhesive copper tape (intended for DIY circuit
manufacture).

One thing to remember is that the greater the gain of any anyenna, the
narrower the beamwidth of the antenna and this makes for more work
keeping it pointed. Aim for a happy compromise.

11:40pm last night in eastern USA I heard someone chatting on AO-51. They were mobile but it was faint, barely hearable. Lasted about 40 seconds. I was using my 5 watt handheld. Is there a better time of year to work satellites? Right now it is not very appealing just to hear someone faintly throw out call signs to collect QSL cards. After field day I may give it up...LOL

Hi Bill,
Satellite working is generally considered to be a weak signal mode, although not in the same class as DX VHF and moonbounce. Thats half the fun of it. If you dont enjoy a challenge then maybe satellites are not for you. The FM birds are easy to work compared to most linear transponder satellites.

Omnis are not ideal satellite antennas although they will work after a fashion for the FM birds.
You should consider a small yagi (DIY even) or similar. There are plenty of designs for low cost, minimal effort DIY yagis on the WWW.

You'd be surprised at what can be done with plastic waste pipe, microbore heating tube and suchlike things.

Hi Folks.

For anyone new to the birds, I recommend listening to William
Leijenaar's audio file of HAMSAT QSO's.

It makes such a nice change from the sheer bedlam generally
encountered
on the FM birds.

You can find the recording in William's folder at..
http://groups.yahoo.com/group/eu-amsat/files/PE1RAH/

Kind Regards,
Al.

Hi William (and Group),

thanks for your recorded QSOs MP3 file via HamSat, I really enjoy it !

Excellent audio and signals, for about 7 minutes with a lot of QSOs
on a single pass over Europe ! FB !!!
BTW I noticed that, the Doppler is minimum, just a fine-tuning at the
beginning
of each QSO.

Pse give us few more details about your setup. Have you any
Doppler-autocorrection
system? Also tell us about your radios and antennas.

73, Mak SV1BSX

PS: I hope to meet you soon on HamSat !

Hi AMSATs,

On the audio file I posted here I used my home station.
Its a FT847 with doppler correction by the hand (I don't like the
automatic PC correction).
Antenna's are 2m RHCP 10el. cross yagi and 70cm RHCP 17el. cross yagi.
I have about 25 meters of H-100 cable between my FT847 and antenna's.

For the uplink I used only 10W as it was more than enough for HAMSAT.
On the downlink I have a SP-2000 mast amplifier, that is in the mast
where it belongs and gives the good receive.

Satellite tracking is done by the good old Instant-Track. I still
didn't find any better windows version, so I stick to this fast and
good sat-tracker.

For the beginners: For satellite, better buy a good mast-pre-amp and
leave the PA for later :o)

73,
William
PE1RAH (Satman :o)

232. Launch date for SSETI Express announced (G3VZV)

Yahoo group: eu-amsat
Date: 2005-05-31 08:08:04 UTC
From: Allan Copland
Topic: 232 Message: 232

Hi everyone.

We have just heard from ESA that the launch date for SSETI Express and the three cubesats UWE-1, Xi-V and NCube II has now been confirmed as Thursday August 25th 2005 with the next day 26th as a back-up.

Pre-launch keps are expected to become available within the next few weeks and will published as soon as possible.

The satellite has now completed all its pre-launch tests and is presently back in the cleanroom where everything is having a final checkout and where the cubesats are currently being "loaded"into their T-POD launchers.

Current plans show that the satellite will be packed and ready for despatch to the launch site during the last week of June.

The webcam http://sseti.gte.tuwien.ac.at/WSW4/webcam.htm remains available and other fotos and the integration logbook (27+MB) can be found at http://sseti.gte.tuwien.ac.at/WSW4/express_downloads.htm

SSETI Express will automatically downlink general telemetry at 9k6 on 70cms and it will also be possible for radio amateurs to request specific downloads. In addition it is planned that the 38k4 telemetry transmitter on 2.4GHz will also be available for amateur voice operation as a Mode U/S transponder after initial tests on the satellite have been completed.

Fingers crossed!

cheers
Graham G3VZV

233. Satellite Construction and testing

Yahoo group: eu-amsat
Date: 2005-06-01 19:58:28 UTC
From: Allan Copland
Topic: 233 Message: 233

Hi,

For anyone with an interest in the construction and testing of artificial Earth satellites, I can thoroughly recommend a trip to

http://sseti.gte.tuwien.ac.at/WSW4/express_downloads.htm

Here you will find a huge volume of material on the construction of SSETI Express, due for launch later this year.

As you may know, members of AMSAT-UK provided some of the space qualified hardware for this mission. The team provided their flight hardware ahead of schedule, somewhat unusual in the satellite world.

The website contains a fascinating photo diary of the construction and testing of SSETI Express in Adobe Acrobat (PDF) format. There is also a photo gallery available on this website.. also recommended.

It provides an excellent insght into the construction of small satellite systems.

The files on this site are *large* with a capital L and you will need a broadband connection. Dial-up is not really suitable.

SSETI Express was also featured in this months 'Radio Active' magazine.

234. SETTI Express launch date

Yahoo group: eu-amsat
Date: 2005-06-02 07:34:33 UTC
From: SV1BSX
Topic: 234 Message: 234

The following was in the weekly news from RSGB:

The script of the weekly GB2RS News Sunday 5 June 2005
SSETI Express Launch Date Announced
The launch date for SSETI Express and three 'cubesats' has now been confirmed as 25 August, with the next day, the 26th, as a back-up. The satellite has now completed all its pre-launch tests and is presently back in the clean room where everything is having a final checkout and where the cubesats are being loaded into their launchers. Current plans show that the satellite will be packed and ready for despatch to the launch site during the last week of June. SSETI Express will automatically downlink general telemetry at 9K6 on 70cm and it will also be possible for amateurs to request specific downloads. It is planned that the 38K4 telemetry transmitter on 2.4GHz will also be available for amateur voice operation as a Mode U/S transponder after initial tests on the satellite have been completed. AMSAT-UK provided the 2.4GHz transmitter for the satellite and a presentation on SSETI Express will be given at the AMSAT-UK Space Colloquium to be held from 29 to 31 July at the University of Surrey in Guildford. All amateurs and SWLs are welcome to attend.

236. AO-7

Yahoo group: eu-amsat
Date: 2005-06-11 08:57:51 UTC
From: SV1BSX
Topic: 101 Message: 236

Hello to Group,

today morning I had a QSO with PH7PCF on AO-7/Mode-A. Then,
AO-7 continued the pass to Africa. Over Egypt (SU) I received an Italian
station
calling CQ on CW... anyway, nobody answered (as usual !) but I was
surprised,
the signal was strong from satellite till the AO-7 was over south Sudan
(ST).
Then I noticed that, if the satellite is over the cross-border between
Sudan, Congo &
Central Africa its an "open window" between my QTH and South Africa (ZS),
with
very low elevation, but may be workable via AO-7.

I wondering if someone of the "Sat-experts" here in the Group knows
somebody
active on Satellites from ZS-land for a possible sked. I have read about a
Ham which is
active on the birds, but I'm looking for him. The point to point distance
between
SV-ZS is about 7000 Km, seems to be a great challenge for a QSO via AO-7!

Bye and have a nice weekend

241. Mode S Doppler Shift

Yahoo group: eu-amsat
Date: 2005-06-15 11:18:18 UTC
From: Bill N
Topic: 241 Message: 241

Mode S doppler shift is +-50

Regular Mode is

435.310 145.915 PL-67 AOS
435.310 145.920 PL-67
435.305 145.920 PL-67
435.300 145.920 PL-67 Mid Pass
435.295 145.920 PL-67
435.290 145.920 PL-67
435.290 145.925 PL-67 LOS

What about mode S, Would there there be 5hz jumps?
Starting where? I know it is +-50.

Thanks

Bill

242. Re: [eu-amsat] Mode S Doppler Shift

Yahoo group: eu-amsat
Date: 2005-06-16 00:01:17 UTC
From: SV1BSX
Topic: 241 Message: 242

Hi Bill,

I've no experience with AO-51 on S-Band, but if the Downlink is 2401.200 (=
mid passband)
and the Doppler in S-band is about ?50 KHz (5 times to UHF-band doppler
shift),
I suppose that:

2401.250 - 435.310 - 145.915 PL-67
2401.225 - 435.305 - 145.920 PL-67
2401.200 - 435.300 - 145.920 PL-67 Mid Pass
2401.175 - 435.295 - 145.920 PL-67
2401.150 - 435.290 - 145.925 PL-67

If we extend the relative frequencies the table it could be:

2401.250 - 145.915 AOS
2401.245 - 145.915
2401.240 - 145.920
2401.235 - 145.920
2401.230 - 145.920
2401.225 - 145.920
2401.220 - 145.920
2401.210 - 145.920
2401.200 - 145.920 Mid Pass (TCA)
2401.190 - 145.920
2401.180 - 145.920
2401.175 - 145.920
2401.170 - 145.920
2401.165 - 145.920
2401.160 - 145.920
2401.155 - 145.925
2401.150 - 145.925 LOS

Finally, don't forget, the table above it's just my opinion - I have not any
experience
on S-band with AO-51.

Hope that helps

73, Mak SV1BSX

Hi Folks,

Does anyone in the group know what the connectors used by HP in their spectrum analysers are called? They look a little like SMA's but are not threaded. These small RF push fit connectors are used in the HP Plug-ins to interconnect the units. They are also used on the rear accessory socket of my SA.

I ask because I need a couple of these connectors and I have no idea what they are called! My Internet searches have not helped either.

Can anyone help with some info please?

Thanks & 73

244. My portable OSCAR antenna on internet

Yahoo group: eu-amsat
Date: 2005-06-19 09:46:41 UTC
From: William Leijenaar
Topic: 244 Message: 244

Hi AMSATs,

After many requests from newcommers on satellite I made a webpage which shows my homebrew portable OSCAR antenna.

This antenna already has proven to be good. It has been used some 4 years ago on my travel through Europe, together with Dirk ex.ON1DLL (now ON5GS).

We made satellite contacts from every country we visited.
The antenna is constructed in a way that the longest part when disassemble is 54cm. This size is perfect to put under, or on top of a pack-pack for globe trekking.
The construction is strong enough to survive heavy weight or people who accidentaly put their feet on the elements (when disassembled)

The gamma match is also protected, as the small capacitor is placed inside a protective square rod.

Just go to the following webpage and see yourself :o)

From my main index:
http://www.qsl.net/pe1rah

Or directly to the antenna:
http://www.qsl.net/pe1rah/port_oscar_ant.htm

Hi William,

sorry but always I have problem with your pictures in your pages
(not downloaded all or most of the pics are corrupted).

I'm using IE6.0 under Win98 & XP, I tried with 3 different PCs
through my LAN and the problem remain the same.
I have problem only with your pages, I've never seen something similar
in other Web-pages.
I was looking inside the "source" of your page and it's really strange.
Probably you write that by using Word 9.0 (?). I think it's unusual
writing for a Web-page. Have you tried the Frontpage? It's excellent
for Web-design, making good and compatible "HTML" pages for all users.

From: Allan Copland
Topic: 244 Message: 246

Hi folks.
Mak said..
> sorry but always I have problem with your pictures in your pages
> (not downloaded all or most of the pics are corrupted).
> I'm using IE6.0 under Win98 & XP

This is an unusual and interesting problem. I looked directly at the antenna pages both from home and from work on both IE6/SP1 and Mozilla Firefox (my usual browser) and in all cases I could see the content of the pages with no problem. The pages are slow to load.. perhaps more to do with William's ISP than anything else.

As Mak mentioned, perhaps Frontpage would be a better authoring tool for these pages.

Kind Regards,
Allan Copland

247. VQ Log

Yahoo group: eu-amsat
Date: 2005-06-28 17:58:10 UTC
From: SV1BSX
Topic: 247 Message: 247

Hello to Group,

I'm using the VQLog for my Satellite logbook.

During the import of a new QSO, I 've notice that:
the program appears in few callsigns automatically the Grid-Square of
the new entry.
Probably these data including into the program. But sometimes this
Grid-square
is different with that I've received during the QSO and I wonder very often
if
my QRA reception is wrong !

Finally, Am I wrong (deaf listener, hi !) or the program is wrong?

I think Gena ES1RF here in the Group, running also this program...
any comment is welcome.

73, Mak SV1BSX

Hi Makis,
sure, I am using VQLog for the several years and can tell you,
that this is the best logging program for VHF chasers, including Satellite
QSO.
Thanks to Gabriel, EA6VQ!
Yes, the program has own data base (VHF Database in the menu).
The data base is old enough. It was created by DL8EBW in 1998 and used in
VQLog, as a sample!!.
You can read that, when open menu: VHF Database->Access by callsign.
Of course, many people has change theirs QRA locators during 7 years,
and, of course, DL8EBW issued new database.
So you can update the database, then you will not have many problems.
I am using also Buckmasters CD ROM (2004), connected to my VQLog:
(Menu>Configuration>Callbook) and it gives more careful results.
But it has also some mistakes.
So, better to update database from DL8EBW and import new data to VQLog.

73! Gena-ES1RF

252. Hamsat FM-QRM

Yahoo group: eu-amsat
Date: 2005-07-08 20:46:58 UTC
From: SV1BSX
Topic: 252 Message: 252

Hello to Group,

today night, during #957 orbit of HamSat (20:10-20:15 UTC), a strong
jamming recorded on downlink.
I had a CW-QSO with F6BEG, but was impossible to complete. On SSB-mode some
kind of distorted audio received on my speaker, something like CQ !
By pressing the FM switch "ON", I received an extremely STRONG, LOUD &
CLEAR signal in "pure" FM-narrow mode:

-"CQ CQ fm RU6JW" !!!!!!!!!!!!!!!!!!!!!

I don't know what is the situation here, but I wondering how is possible to
use
someone FM in this bird, the same time which several stations have QSOs
on SSB and CW.

Finally, is it the HamSat for mix-mode including FM or not?
If not, someone must be tell to this guy a few words about it.

73 and have a nice weekend (from HOT Athens / 35? C)

Here in the Philippines I have been getting interference as well from locals playing music and rebroadcasts of stations like DZMM or DZBB during the news programs. I tuned to 145.800 to see if I could catch the passes of ISS and heard other kinds of radio being transmitted. Wish they find another place to play

Hi Mak.

Hamsat is a narrowband AM bird only. This was its intended purpose.
CW, SSB and narrowband modulation schemes only.

Remember that an AM (AKA 'linear'... with class AB amplifier stages) transponder will transpond anything t copies.... including FM of course.

I dont think the situation was helped by certain postings in the past suggesting it could be used for mixed modes.

As you have found out the hard way... AM and FM are incompatible. An FM transmission through a linear bird will always 'win' the transponder.

The modes are mutually incompatible.

From: Allan Copland
Topic: 258 Message: 258

Hi Folks,

Does anyone in the group use the Meteosat Weather Satellite system?

I'm interested in concocting an antenna and front end for 1.691Ghz
that
I can use with my Icom PCR-1000 'virtual radio' to decode data from
this bird. I have a diy local oscillator on 1.152Ghz that could be
mixed with the satellite signal to give an IF around 539Mhz.
I'm thinking a long DIY RHCP helix feeding a gain stage and active
mixer might be a way to go.
Most folks would use a DISH with an RHCP feed and a 1691-136Mhz
downconverter but I dont have the space for a dish. Helicals are not
so good as a dish but can fit in a small garden.
I'm just interested to see what can be done with DIY equipment.

260. Field Day & Mobile Setup For Satellite Tracking

Yahoo group: eu-amsat
Date: 2005-07-13 13:43:54 UTC
From: dallasrodgers2000
Topic: 260 Message: 260

FYI, I posted some photos of the setup we used to track satellites on Field Day, as well as a mobile setup we used to learn how to track and contact satellites. For Field Day, we used a modified dobsonian style telescope that I own. It worked great as a solid ALT/AZ platform, using the drive motors for ALT/AZ movement, or freewheeling by hand. We used printouts of the ALT/AZ headings in 30 sec. increments to track the satellites. I used ground board aligned with north and marked for each 10 degree azimuth heading, and used a cheap inclinomoeter available at a local DIY store. Antennae (2M/440 Yagi & 2.4GHZ) were mounted on two PVC pipes lashed to the truss assembly of the scope. Also included is the comparable mobile setup with the same basic capabilities. The radio we used was the ICOM 910H. Dallas Rodgers (KI4FUF)

263. Re: [eu-amsat] Looking for design of PA on 70cm

Yahoo group: eu-amsat
Date: 2005-07-14 23:09:35 UTC
From: SV1BSX
Topic: 262 Message: 263

Hi Villiam,

I had the same problem, when my UHF-PA destroyed.

I have now a small PA, I bought it from eBay 2 months ago and if you
want I can send it you a foto with construction and diagram (15 Watts output
with 5 W input, by using the SD1429-03).

On the other hand, you can make easier a UHF-PA by using
a module. The module offers easy construction, high Gain
(from 50-100mW Input / 10-30 Watts or more output, depend on
the type) but is more expensive.

If you want my opinion, the module is better solution and the
higher price finally is not problem, because it's easier construction,
more flexible and if you follow the basic principles on UHF, the
unit is 100% workable. In contrast, the UHF transistors need
experience, PCB, good construction, good quality components and
surely from 2 to 10 Watts is not enough a single stage (you need a
transistor with 8-9 DB gain on UHF.... Hhmmmmm - difficult I think).
And sometimes, you have not the fate as you expect.

A good choise for UHF module is the RA30H4047M (30W), as John LA2QAA
suggested to me few months ago. May be is too much power for you, but with
that you have enough Power for any future bird, including the next P3E.

On AO-40 (the old good days!), 15 Watts and 10 Elements Yagi (11 dBd
theoreticaly) was enough for me to accessing the Satellite. My 15 Watts-PA
was behind of antenna
(no coaxial loss), in order to achieve the maximum ERP (15 Watts x 11DB
about 180 W ERP).
If you have 30 Watts, may be is possible to keep the PA into the Shack. (in
case where you have Low-Loss Coaxial (< 3DB), between Shack & Antenna).

The big Power easily decreased.... the low Power with difficulty is
increased, especially on UHF !

Just keep in mind that.

A link for the module is:

http://dl2jwl.de/modul/RA30H4047M.pdf#search='RA30H4047M'

Hope that helps

73, Mak SV1BSX

As Mak mentions, Mitsubishi 'brick type modular PA's are a useful and neat solution.
The only thing I would add is that the older (bipolar) Mitsubishi (M series) modules seem to deliver a bit more power than the newer (MOSFET.. RA series).

However for your application, either type should be OK. The modules are generally designed as a cascade of three amplifier stages. You can find the data for them on the Mitsubishi website.
You need to provide a good heatsink (they are quite inefficient) and a regulated bias supply plus decoupling for the various stages.
It is very simple and straightforward though.

Best of luck with your project.

Topic: 262 Message: 265

Hi Mak and Al,

thanks a lot for information! I have a home built transverters on 70 and 23cm, so theese useful informations are really helpful for me.

Both designs produce from the bipolar transistored PA about 1-2 watts. But I will try RA30H4047M on 70cm (I have 50mW before the last power amplifier stages on another PCB) and probably RA18H1213G on 23cm (looks very fine!).

Prices isn't bad, I could obtain them in Slovakia for double(!) price, the German prices are really good, so I order them from DL.

Thanks for help!

Topic: 262 Message: 266

Hi again,

For 70Cms modules try http://www.rfparts.com/module.html

The M57716 (17W for 200mw input) and M57729 (30w for 300mw input) look like promising candidates. M series units are Bipolar and probably produce more output than the RA series equivalents.

I personally have used one of the RA series 430Mhz amplifier modules (built for LA2QAA) and found that it delivered a bit less RF than expected.
I also use a pair of the M series 23Cms modules and have found them to be dependable and easy to use and easily deliver the stated output.

If you go down the road of using the Mitsubishi modules, take care that your heatsink is perfectly flat and do not use excessive amounts of heatsink compound. The amplifiers are thick film hybrids mounted on a flat metal bar to take the heat away. Any bending or flexing of the unit can lead to stress cracking of the amplifier substrate. These units are in use in commercial service in their tens of thousands so they have a good pedigree. They also have the advantage of simplicity.

Regards,
Al.

Hi Villiam.

If you use a Mitsubishi brick, the older M57716 is recommended for
Clasc AB (linear use).

The M57729 is only suitable for Class C (FM)

I hope that helps you.

Regards,
Al.

268. PSK 31 and A0-51

Date: 2005-07-15 12:44:13 UTC
From: Bill N
Topic: 268 Message: 268

Looking at PSK-31 Uplink 28.140 MHz USB with AO-51.
Are many people using this mode? Will a horizonal wire
antenna mounted be OK?

Appreciate any help or commment!

Bill

270. Re: Re[2]: [eu-amsat] Looking for design of PA on 70cm

Yahoo group: eu-amsat
Date: 2005-07-15 13:50:48 UTC
From: SV1BSX
Topic: 262 Message: 270

Villiam,

I will put on "FILES" a diagram of a similar construction with M57729
UHF-modular 40 Watts (UHF-Homebrewing DIRECTORY).
It was published on REF Magazine few years ago, I think it's a fine
construction
by DF2FQ. You can take some ideas from that, is exemplary design including
Pin-diode "change-over" fast circuit, for TX-RX.

BTW I have the complete article in PDF (about 850 KB, in French).
I tried to "upload" that into EU-Amsat files, without success. For unknown
reasons I can't
upload files bigger than 300 KB ! (perhaps the fault is my slow connection)

If you want the complete PDF, I can send it in your personal Email.
Including some fotos with Hotsink, the PCB etc.

It would be useful, if someone can send it (upload) into EU-Amsat files for
sharing from
other members.

271. Maypole antenna for 28-30Mhz.

Yahoo group: eu-amsat
Date: 2005-07-15 14:57:46 UTC
From: Allan Copland
Topic: 271 Message: 271

Hi.

Re antennas for 28-30Mhz

I dont use PSK-31 but one of the best antennas for satellite use on 28-30Mhz has proven to be the 'maypole'. They are also very cheap to make. This is a good thing in their favour.

The 'maypole' is simply a nest of switched inverted Vee's disposed around a central support in the form of a 'maypole'.

This arrangement allows you to switch between antennas for the best signal. Cheap commercial relays work fine as switches on 29Mhz... no need for anything expensive here. A simple DIY switch box to swap the feed between the different dipoles is all thats needed.

The 'maypole' was popular as an antenna with the old Russian RS analogue linear birds.

Have a word with LA2QAA re maypoles. He published an article on them in the past in the UK AMSAT Oscar New magazine.
John LA2QAA can be found at LA2QAA@....

I hope this is of some help to you.

Hi Bill,

I will disappoint you, but the PSK-31 via the AO51 it's a big "fiasco".
Never done a complete QSO !
Even Peter Martinez (creator of PSK) did not realise a contact !

I tried few months ago on this mode. BTW on HF I've a very good organized
Shack.
I'm HF operator (mainly) for about 25 years and I have also enough
experience on HF/PSK.
My uplink tests on 10m became by using various antennas, with high enough
power in order
to listen my return-signal on downlink. Well, that was possible by using 300
Watts uplink-power (!), but the decoding was 50% garbages on my screen, even
the "PSK tone" on my downlink receiver was "Loud & Clear" . (With lower
Uplink-power, the downlink was weak, almost "unreadable" on my screen !)
As I know, the same thing observed by several other Hams WorldWide.

This mode through this satellite is in practice unworkable.

So, at my opinion don't spend your time.

Several people mentioned to me that this was more than likely to be the case *before* A-O-51 was launched. I wasn't about to disagree with any of them.

It rather makes me wonder why AMSAT thought it was a good idea.

LEO microwave birds are another good example of inappropriate use of technology. The doppler shift on a microwave LEO is ferocious. This was proved a long time ago with among other things the Surrey University UoSATs.

Placing microwave transponders on LEO's effectively excludes anyone not rich enough to be able to afford automated doppler tracking (IMHO much of the world). There again, just using microwave effectively accomplishes that!

I have nothing againt microwaves. In fact I'm a big fan, but not on a LEO satellite please.

Oh for the days when we had birds that almost anyone could use.

Its a l o o o o o n n g g time ago, but I can vaguely remember them being called MODE A, Mode J and even Mode B. I remember plenty of enthusiastic people too, because it was so easy to get involved.

Hell, it even worked for poor people!

OK, it was not sophisticated, and not hugely exciting for the designers, but the users sure loved it and it was a LOT of fun.

Kind Regards,

Allan Copland

From: Emily Clarke
Topic: 278 Message: 278

You weren't specific about what kind of antenna, but you could technically cut any piece of wire into a dipole and make it resonate. This is what the HF guys do with slinkies. But there is no significant gain, so after adding in a balun you would probably have an antenna that would be worse than a HT with a whip.

If you are talking about a helix, you would need two different sized slinkies. However the slinky is also very thin wire, so I think the bandwidth would be narrow and tuning the helix would be more difficult. I think you would be better off using some kind of copper tubing such as the tubing used for installing icemakers.

From what I've heard it was pushed by one individual who wanted to jump on the PSK bandwagon. This person has promoted PSK on other satellites as well. I had the opportunity to ask him if he ever tried PSK-31 on FO-29 and his response at the time was "What's FO-29? - That dead Japanese satellite?"

While there is nothing "technically" wrong with it, having tried several PSK experiments on AO-40 I wouldn't waste my time or effort with it on a LEO. I am convinced there are no advantages to using the mode - it's too slow and too unreliable. However I don't believe doppler is the only problem with this mode on AO-51 - I believe it has more to do with the inefficiency of the SQRX antenna at 10M. Or so I have been told.

>LEO microwave birds are another good example of inappropriate use of

I wouldn't know why anyone would need to prove this - it's a simple math problem. :-)

Although it's not what I would like for a primary mode I don't see the harm. It's not like we have any other satellites using that part of the spectrum at the moment. That might change of course, but looking over the band plans for SSETI and P3E it doesn't appear that there is any mutual interference.

>Placing microwave transponders on LEO's effectively excludes anyone
>not rich enough to be able to afford automated doppler tracking (IMHO

>accomplishes that!

I don't know if I agree with this completely. It cost me less than $10 to interface my computer to my rig. So cost was not prohibitive.

Having worked with manual tuning on AO-51 it's also not as bad as you think, at least with a 910H. Even working completely manual the only difference between working 70cm is that I increase the tuning step.

And the 910H makes it even more simple. Once you locate the carrier, the AFC on the 910H will automatically tune the receiver to keep it on the center frequency. But I agree it's not ideal and computer control is the best way to make it work.

I think 2.4G has a wonderful place for TLM and other digital modes where things can be automated. However, for a voice QSO I'll take the lower sideband modes.

>It rather makes me wonder why AMSAT thought it was a good idea.

(Emily) From what I've heard it was pushed by one individual who
wanted to jump on the PSK bandwagon. This person has promoted PSK on
other satellites as well. I had the opportunity to ask him if he
ever tried PSK-31 on FO-29 and his response at the time was "What's
FO-29? - That dead Japanese
satellite?"

(GM1SXX) Well, I guess that this un-named person must have a fair bit
of clout at AMSAT.
What happened to SURVEYS, the use of... used for decision making?
I'm sure you will remember that episode.

PSK is a narrowband mode and of course doppler shift makes life
difficult with such modes. It is not well suited to communication via
a (fast) moving target.

(Emily) While there is nothing "technically" wrong with it, having
tried several PSK experiments on AO-40 I wouldn't waste my time or
effort with it on a LEO. I am convinced there are no advantages to
using the mode - it's too slow and too unreliable. However I don't
believe doppler is the only problem with this mode on AO-51 - I
believe it has more to do with the inefficiency of the SQRX antenna at
10M. Or so I have been told.

(GM1SXX)Well, there *is* something technically wrong with it.
Doppler will certainly be a problem. As to SQRX antennas, I cant
comment.
SQRX is a meaningless term to me. I only know about conventional
antenna types.

>LEO microwave birds are another good example of inappropriate use of
>technology. The doppler shift on a microwave LEO is ferocious.
>This was proved a long time ago with among other things the Surrey
>University UoSATs.

(Emily) I wouldn't know why anyone would need to prove this - it's a
simple math
problem. :-)

GM1SXX) I totally agree. The practical issues go without saying, so
why are so many new LEO birds using microwave links? Perhaps AMSAT
know something about the behaviour of microwave that I dont. I always
believed that doppler shift increases as a function of frequency. This
is backed up by personal experience.

(Emily) Although it's not what I would like for a primary mode I don't
see the harm. It's not like we have any other satellites using that
part of the spectrum at the moment. That might change of course, but
looking over the band plans for SSETI and P3E it doesn't appear that
there is any mutual interference.

(GM1SXX) I see a great deal of harm.
Satellites cost money. A lot of money, even amateur ones, straight out
of paying members pockets. Why waste money and resources on
inappropriate technology? This is a slap in the face to paying
members, unless of course they *really* want to have such
transponders.

>Placing microwave transponders on LEO's effectively excludes anyone
>not rich enough to be able to afford automated doppler tracking (IMHO
>much of the world). There again, just using microwave effectively
>accomplishes that!

(GM1SXX) I still stand by this point.

(Emily) I don't know if I agree with this completely. It cost me less
than $10 to interface my computer to my rig. So cost was not
prohibitive.
Having worked with manual tuning on AO-51 it's also not as bad as you
think, at least with a 910H. Even working completely manual the only
difference between working 70cm is that I increase the tuning step.

(GM1SXX) Sure. You have a fairly modern radio and live in a rich
country. Not everyone who aspires to use, or helps pay for, amateur
radio satellites does.

(Emily) And the 910H makes it even more simple. Once you locate the
carrier, the AFC on the 910H will automatically tune the receiver to
keep it on the center frequency. But I agree it's not ideal and
computer control is the best way to make it work.

(GM1SXX) I dont think many people in India, Africa or many other
places outside of the rich countries of the world own an 910H. Many
people still have VFO based radios. Auto Doppler tracking is fine if

you own a modern PLL radio with a CAT interface *and* a computer. Of course you also need keplerian elements to load into your tracking program. The Internet perhaps? For that you need a MODEM and a phone line too. I've heard some complaints that amateur satellites are a rih man's hobby. You certainly seem to be justifying that complaint.
I'm lucky. Very lucky in fact. I *do* have access to many of these things but I also appreciate that there are far more people who dont.

(Emily) I think 2.4G has a wonderful place for TLM and other digital modes where things can be automated. However, for a voice QSO I'll take the lower sideband modes.

(GM1SXX) Well there I have to disagree. The 2.4Ghz ISM (Industrial Scientific and Medical) band is shared with point-to-point links, Wireless LANS, microwave ovens (typically 800W@2450Mhz. broadband untuned RF ...and yes, they leak), plus hospital and industrial equipment.
In short, the 2,4Ghz band (around here at least) is saturated with Primary Users.
I work in a large further education college and we can hardly communicate from a WLAN to a laptop PC in the same room thanks to radiofog. Here at least its an absolutely lousy band for satellite links, and thats before you consider doppler.
In this area alone, there are dozens of WLANS (that I know of) plus industrial users.

(GM1SXX)I'm committed to the idea that amateur satellites should be for all radio amateurs, not just the rich ones.

73 Al.

282. Slinky

Yahoo group: eu-amsat
Date: 2005-07-24 18:59:52 UTC
From: Allan Copland
Topic: 276 Message: 282

Hi Mak,

I can answer that one for you.

Slinky is a children's toy. Its a steel coil spring wound from flat metal (steel) tape.

The idea (for kids at least) is to make your slinky walk down stairs and other inclines.

Of course they can also server duty as aerials! When suspended from a length of cord, a pair of slinkies makes an adjustable dipole antenna.

One problem is that they can corrode outdoors and so are mainly suitable for portable operations.

You can find 'SLINKY' springs in many good toyshops. They have been around for a long time and are still popular. Take care to get metal and not the plastic ones!

Regards,

Al.

I am no way an antenna expert. But, the design of the slinky seem to be polarized. Just curious as to it usefullness as an antenna satellite.

Hi Bill,

Re SLINKY's on VHF/UHF

I dont see much point in trying.
There are easier and cheaper ways to make VHF/UHF antennas.
You could try Jerry Brown's website for ideas. His call is K5OE. A Google search will find his pages where you can find all sorts of innovative ways to use scrap plastic pile and wire! Its cheap and its fun. It also works.
What more could you want?

By way of an explanation... slinky is indeed in the form of a coil of wire but when a pair are stretched out on an insulating line, they form a shortened dipole and not a circularly polarised antenna.

You can compare them with the shortened inductively loaded dipoles made commercially.. think Buddipole etc.

Think of a stub antenna (stub helical) of the sort used on some handy's. Although these look internally like a miniature slinky, they produce linear polarisation.

Sure, for VHF and UHF you can indeed use a helical antenna and reflector to produce circular polarisation but each turn (when straightened out) is about one wavelength long. The slinky is way too small for that.

You are confusing normal mode and axial mode helical antenna types. They work differently.You can find much more data with a simple web search.

One other thing many people dont realise about CP antennas that is worth knowing is that the polarisation of a CP antenna is *only* circular along the boresight of the antenna.
This is true whether the antenna is on a satellite or on the ground.

You only get CP when looking straight down the boresight.
At *all* other angles, it is NOT CP.

Rarely are you ever pointed exactly at the boresight of a satellite.
The same is true of the satellite 'looking' at you.
You can safely assume that most of the time you are not copying (or transmitting a true CP signal.

I'll leave it to you as a mental exercise to consider the consequences of this dilemma.

In the meantime, have a look at http://members.aol.com/k5oe/
for useful things to do with scrap materials.

286. Good Morning with SATs !

Yahoo group: eu-amsat
Date: 2005-07-27 09:50:19 UTC
From: SV1BSX
Topic: 286 Message: 286

Hi to Group,

well it's nice with morning-coffe to have a conversation with good friends through
the Satellites.
Today, I had a nice conversation with I8CVS on FO-29 with S9+ signals,
this SAT is in great shape (and it's not a dead Jap's bird, as "someone"
mentioned !!!!!!!!!!).
Domenico he told me about nice contacts with ST2ES in Sudan KK41NJ and
with Oleg EX8MLT in MN72HT, via FO-29 few days ago!
It's very interest another observation of Domenico: as he said, FO-29 has not
perfect eccentricity... so the next months the apogee of satellite will increasing on passes
over Atlantic Ocean. That is a great opportunity for DX contacts between Europe and
Canada or East coast of USA, as the apogee it will become maximum (1300 km)
around October 2005.
Really, very nice comments !

Few minutes later, I had a second conversation with OM0AAO, Villiam via AO-7/Mode-A.
AO-7 was audible till South Africa... I lost the signal at 6-7? Elevation, about a minute
before theoretical LOS of bird. Nobody answered to my continual CQ.

After that, looking my transceiver I thought , what bad-luck the loss of AO-40...
almost 18 months without it... these mornings in summer vacations is a great
opportunity for few more hours with HAM-radio, especially the mornings, as
we are free from our jobs .
I remember with nostalgia the excellent morning's DX windows of AO-40 with
Japan, Indian & Pacific Ocean, Australia.
Unfortunately the LEOs are "fast - low range birds", no chance for
"bla-bla" and Satellite-DXing. On the other hand, the HF-propagation is very
bad this period, low solar-cycle.

BTW few days ago I had a nice QSO with Suli, 7Z1SJ, not in the "birds" but
on 20m. HF Band !
The contact was short, because Suli had a pile-up, as usual ! In fact,
7Z prefix is rare anywhere, SATs and HF ! (Lucky man!)

Well, I'm waiting for the new HEO... I hope the next summer will be in
operation the P3Express ! Life is too bored without a HEO.

Wish to all members of the Group a nice (rest) summer + relax on vacations.

73 from "cool" SV-land (only... 35? C today, nice day in contrast with 41?C two days ago!)

Topic: 290 Message: 290

The following message is QSP from G6LVB:
==========>>>>>>>>>>>>>>

Folks

I will be travelling to Svalbard (JW prefix, 78.15 deg N, 16.02 deg E) in the next few weeks (currently I am looking at 26, 27 and 28 August) to do some minor upgrades to a satellite station at www.svalsat.com. I am intending to take some LEO satellite gear with me, so if you'd like to add JW to your DXCC list let me know.

Despite its northerly location, it has coverage to Canada and the North Eastern US as well as Japan.

I will definitely be active on AO-51, SO-50, AO-27, PO-28 (let's hope) and if I have room for SSB equipment I will operate FO-29, VO-52 and possibly AO-7. The ISS never travels far enough North for me to take a shot at it.

There are no plans to take any HF gear, whatever that is ;-)

291. FT817 Setup

Yahoo group: eu-amsat
Date: 2005-08-23 19:01:34 UTC
From: g0oxv
Topic: 291 Message: 291

Hi all,

Very new to this Satellite ops mode. I am hearing the "Birds" ok but not having any luck trying to talk through them.
I am using a 3 ele 2m beam which works ok on 70cm too. i then use an FT817 in split frequency mode. The specific Bird i am trying to acess is A051 though had ago V052 in ssb mode.

I now have a registered copy of SatPC32 and was hopeing to control doppler effect using this program with the radio connected to a laptop.

However i am not getting anywhere with the setup for this program. Has anybody got any ideas or the config for controlling the 817 from satpc32. If i can crack this doppler it might free up a multiple arms in panic mode for the 15min pass.

Apologies if this is old ground to some but help would be appreciated

Hello Keith G0OXV,

I use SATPC since many years (started when it was still in DOS version ...)

It is no problem to run the nice FT817 with SATPC32, I tested it several times. Now running SATPC v12.3 (the explanation below refers to this version)!

1.. You must declare the proper COM port in SATSETUP basic settings for CAT. Set CAT delay to 100 to start with... you can try to lower this value later (maybe to 50 or 70 .... till CAT becomes unreliable...)
2.. Then in PROGRAM OPTIONS, select radio type MODEL to YAESU, and of course FT817
3.. In same options, now select Baud Rate (same drop down list box as MODEL) and select the baud rate of your FT817 (take the highest possible on the FT817, it works fine)
4.. in the PROGRAM OPTIONS, now press STORE.
5.. Check the DOPPLER.SQF file (it is in the program folder where SATPC32.exe is running). This file stores all frequency, mode etc. The SAT name at start of each line must match exactly the name of KEPLER data !
6.. Exit program and restart SATPC32
7.. Now click (if necessary) in main screen on top left 'C' till it shows 'C+' - now CAT is enabled !
8.. You should see FT817 frequency change now... As the FT817 is not a full duplex TRX, the software very briefly swaps between VFO1 and 2 to set corresponding TX and RX frequencies (not while you are effectively transmitting !)

Best 73s and CU on sat !

Hi all

Many thanks to Jean Jacques for the information.

It looks like i have a previous version of PCsat32 the version i have
is 12.0 from the Amsat uk site, i overlooked this was a trial version.
but led to believe all it needed was a registration.

The registration i bought from amsat-na..still live and learn,

I will get a version of 12.3 as it seems to cater for the 817.

again many thanks Jean.

Topic: 296 Message: 297

Hi Allan & welcome to the Group,

FODTRACK is a simple & cheap Tracking-interface for AZ/EL, working from LPT port.
The basic program (fodtrrack.exe) running under DOS, like IT (IT=Instant Track) .
I've no experience with IT and Fodtrack combination, because I'm using the Fodtrack
with NOVA-tracking program which supports the Fodtrack-interface.
However, is available a small tool-program for cooperation between IT & Fodtrack (foddrv11.zip, 13KB). FODDRV is a DOS TSR
(terminate-and-stay-resident) program which allows satellite tracking programs such as InstantTrack to control antenna position using the FODTRACK antenna interface.

You can find FODDRV into AMSAT Web-page:

http://www.amsat.org/amsat/ftpsoft.html

==========

FODTRACK Antenna Tracking-interface is available at:
http://www.qsl.net/ve2dx/projects/fod.htm

Hope that helps. If you have any additional question, just let me know.

298. Sucessfull antennas for FO-29

Yahoo group: eu-amsat
Date: 2005-10-08 16:17:16 UTC
From: OM0AAO Viliam
Topic: 298 Message: 298

Hi folks,

I am back after long restortation of my house. During the sommer I made new antennas and bought new transceiver, the FT-857D.

On 2m band I could use 2x3el.cross yagi or 8el.yagi and 25W. That seems enough for most operation.

Which antennas are You using on 70cm band with FO-29 SAT? I put on the mas my old DL7KM twinquad (cca. 7,5dBd). During last pass I made my first QSO via FO-29 with DC5MS, but all signals on FT-857 are very low.

So I am thinking about yagi with gain about 11,5dBd and preamp with dual gate MOSFET (NF. about 2dB). What shoul I expect?

Hi Viliam & Group

>
> On 2m band I could use 2x3el.cross yagi or 8el.yagi and 25W. That seems enough
> for most operation.
>
...I'm using about the same antenna (2x4El cross). Its enough but, I know that the reception
is much better with bigger antennas, especially on AO-7/Mode-B. In any case, because
I don't like the "monster-type" antenna-systems, I'm satisfied with my antenna even I know that
my reception is weaker compared with bigger Yagis. For Uplink, its enough if you have
TX-power 25-50 Watts in most cases... a mere example is the AO-51 which usually has
heavy QRM. I have access into this bird over the QRM with my Hi-Power (50 W).

> Which antennas are You using on 70cm band with FO-29 SAT? I put on the mas my
> old DL7KM twinquad (cca. 7,5dBd). During last pass I made my first QSO via FO-29
> with DC5MS, but all signals on FT-857 are very low.
>

.... well, on UHF I've tested two different antennas: 2x7 El (commercial, manual gives 9 dB for each one) and my old homebrew 10 El in vertical polarisation, which I had used for my
AO-40 Uplink (based on ON1MU model, 13.5 dBi or11.4 dBd according to Yagimax).

It's strange but the 10 El (just one antenna in "vertical" pol.) hears much-much better,
far way than 2x7 Cross !
I can't expain that, I can suspect just that the commercial 7 El has not this gain as manufacture promises. I plan to make a second
10 El homebrew to put in cross with my first-old 10 El Yagi. But (at my opinion) is obvious that, this antenna-model of ON1MU 10 El. Yagi is excellent design.

Keep in mind, always in cross yagis I'm using the "shift technique", in other words the vertical antenna is shifted-forward from horizontal (or vice-versa) a space
equal to quarter-wave, into the common boom.

This is the easiest method for circular polarisation, works 100% and you don't need "phase stub" for phase-shifting. Just 2 pieces of quarter-wave 75Ohm coaxial from each antenna-dipole to a common-point ("T" connector) and after
that 50Ohm coaxial as usual up to the shack. The only disadvantage is that, you have only RHCP or LHCP, depend on your cross-setup. However that is not problem, the majority of Satellites have RHCP.

BTW (my personal note), on my RX-system the FO-29 has strange behavior, that means sometimes I can hear the SAT with good enough downlink signal, some other times is
very weak (but always easy workable) and definitely the FO-29 is a very weak SAT also for me.
So I suggest you that: listen the FO-29 for a long enough period before your decision about the antenna which you have now in use.

> So I am thinking about yagi with gain about 11,5dBd and preamp with dual gate
> MOSFET (NF. about 2dB). What shoul I expect?
>
...hmmm ! "Big case" the pre-amp Villiam ! I'm using a preamp, its spectacular the
improving of reception quality with this unit but:

1) for UHF you need a GasFet preamp - NOT a usual DualGate MosFet, because the only
good enough DualGate for a similar unit on UHF which I know wide available was the CF300 (by TFK), but I can't find that anylonger in market place.

2)The usual UHF Dual Gates Mosfets are not good enough for a Low Noise UHF pre-Amp (LNA). You can find now the old BF900, 960 etc. These components are commonly available in market (was usually first stage into TV-UHF Tuners) but the NF
is not acceptable for our LNAs. Just the BF981 of DualGate-family has about 1 dB NF , but on PHILIPS's Data-Sheet the "ft" (Highest Freq.) is upto 200 MHZ.
However, I had read on Internet a UHF antenna preamp construction with BF981 (!!!),
but I'm really very-very incredulous
man if that working in practice on 435 MHZ (I don't believe it, honestly!).

I've made 6 months ago a unit with BF960 (that is 100% for UHF !) and the overall
noise during reception was much worst than basic noise of my receiver without BF960-preamp ! I suspect this component has NF higher than 5-6 Db (or more), so just forget it !!!
And I think that is expected, these components are mainly for TV-Tuners and the
TV receivers need about 57-60 DBuV (at least .... 500 uVolts or 0.5mV) signal strength
for a quality picture without noise on screen. Its obvious that, these

components
are not manufactured for low & weak signals and does not have any care for low
NF.

3)Is much more acceptable a preamp with a bipolar Hi-frequancy transistor like BFW96, than
BF960 and similars DualGate. As I know (theoriticaly) is possible to make a LNA with NF(Noise Figure) around 1.5-2 dB, by using the BFWxx hi-freq bipolar transistors. (note: it is not my personal opinion that, I've no experience with BFWxx-family, just I have read that in similar books.)

So, if you thinking for a LNA, you should find a GasFet (or HEMT). These components
have a NF better than 0.5 dB and Gain about 15 dB at 435 MHZ. By using LNA with
similar components, the improving of receiving signal from Satellites is spectacular !

The LNA that I use is homebrew, based to a Jap's design (I don't remember the URL now but it is on my
Webpage (www.qsl.net/sv1bsx/sat.html) .

I have two "Links" for 2 similar constructions there, first one from JA and second from a DL-Ham. Both LNAs use RF-metal box and is closer to a.... plumper's construction than electronics !!! The first one appears "feedback" and seems to be very
shrewd stage. Is possible to prevent the feedback by using a very small ferrite bead through "drain's" leg and if you do it that the LNA works good, I measured 22 dB Gain (!)
with NF = 0.48 dB (FHX35LG GasFet).

But sometimes the unit is unstable, especially during the tuning, so needs enough patience till
the final alignment in order to have best "quieting" (= lower NF) and enough efficient amplification. It's hard job but if you do well that, the final result is
magnificent !

I've made also the second, but the Gain of this unit never exceeded the 10 dB Gain!

The last months I've designed a new LNA with "strip-line" technique (no Coils, no Tuning-rods anymore), so its much easier
the construction on a double-side epoxy PCB. The first result is excellent, this pre-amp
is "free-feedback"
and the tuning is extremely smooth and easy. I'm still working on this, I've no put it yet behind of my antennas,
just on my bench. I'm thinking for a test with ATF10136, a GasFet with superior
Dynamic Range

and Lower NF than previous GasFets (typ. 0.35 dB/500 MHz). This component is used
from Hi-Q commercial UHF Ham LNAs nowadays and sold with a price of about ... 200-250
Euros in Germany ! (note: the ATF10136 costs just.... 10 Euros !!)

If you can wait few months, till my final and fully tested construction, probably I will make
few pieces PCBs in order to construct few LNAs for some friends and for those which need
LNA here in the EU-amsat group.

Ahh ! BTW, have you a good coaxial-cable between UHF antenna and UHF-rig???
My first coaxial was RG214 "mil-spec" and I was almost "deaf" with birds. I wondering few
years ago what is going wrong with my UHF-setup. A friend of mine he said me about a
simple test:

-"replace your coaxial with a top-quality TVRO (75 Ohms) coaxial which is cheap, in order to
compare the coaxial cable with TVRO. If you have not differences, your cable is OK."

So, I replaced my coaxial with a good-quality TVRO coaxial cable. Well, I was
fully surprised after that,
I noticed spectacular improvement with new TVRO coaxial ! It was possible to listen all Satellites much-much better !
Of course a TVRO coaxial is not recomended for TX (plus a mismatch 75/50 Ohm), but the latest TVRO coaxial cables are excellent for reception and sometimes are superiors from the most HAM-cables.
So, for a test its a good idea to compare your cable with a TVRO coaxial.
Sometimes the reason for a poor-receiving is a not good enough coaxial, especially on UHF band. And, in any case if the TVRO has much better receiving, do not keep it ! Replace your
old coaxial with a new, good quality coaxial like H-100, AirCom-Plus (-8.2 dB /100m at 435 MHz) or the better Ecoflex15 (-6dB Loss /100m at 435 MHZ).
They are expensive cables, but sometimes we don't need LNA, simply making change of coaxial cable!

I don't say you anything about "hardline" because is very expensive but, if you
thinking the 1.2 GHz is necessary if you have a long distance coaxial cable between shack and antennas (like me!).

That is the story dr Viliam with.... ..... few words!!! (Hi hi !)

I hope that Email helps you .

Hello Mak!

Thank You for comprehensive informations. On the pictures is a situation few days ago. Now I have changed 70cm DL7KM for 13el.DK7ZB (3m long boom) and it's much better. Most signals are readable, but some weak are still bad.

Coaxial cables are RG-213 type, but only 8m long. So this is not so bad I hope.

I will try to find somewhere here in shops a MGF1302 TV preamplifier and build an 432 MHz preamplifier.

Hope to find You soon on the bird Mak!

Hi Viliam,

About FO-29, I thought also that the SAT is very high this period as the apogee is maximum (upto 1325 Km over NW Europe) during this month. I tried to listen the last 2-3 days the satellite and I noticed that like you, the downlink is very-very weak. Yesterday afternoon was unreadable my Downlink signal (I was alone - no traffic), even my antennas was straight-forwad to Satellite with AZ/EL in auto-tracking and my maximum power for Uplink (about 200 W ERP).
Just for about 1 minute was possible to hear very weak my CW-CQ. In any case, is possible to exist some
problem in my reception (I will check it that), but on th other hand may be my suspicion for relation between high orbit (from 800 to 1300 Km apogee) and weak-signals is real.. I don't know.... simply a thought.
It would be useful a second opinion (or report) from somebody of Group, which hears the satellite the last days.

Hi Viliam & Group,

nice to hear that about your good reception of FO-29 with your new 13 el.
yagi antenna.
Yes, I saw your pictures and I noticed that your old antenna was not the
best one
for FO-29 downlink. Don't worry also about your Email with attach-pictures,
no problem
at all on Group with that.

BTW my previous Email was not right, FO-29 is heard good enough from 1300
Km.
Just a trick-cheap N-type connector without good contactivity on central
contactor, behind of my UHF-rig was the problem for my poor reception!

Hope to "CU" soon on the bird.

304. The JT-208 Another threat to amateur radio

Yahoo group: eu-amsat
Date: 2005-10-20 07:38:36 UTC
From: Allan Copland
Topic: 304 Message: 304

Hi Folks.

I notice that quite a number of sellers on EBay are offering cheap imported FM transceivers covering 136-174 (JT-208) and also the 70Cms band.

Few if any of the adverts point out that it is not legal for members of the general public to transmit with these radios and many adverts encourage the user to monitor utilities with these radios (illegal in the UK).

Until the authorities crack down on the import of these radios (and how likely is that?), I think we can look forward to plenty of intruders in the 2M and 70Cms satellite sub bands, not to mention intrusions into PMR and other licenced user bands.

Perhaps its just as well these radios don't cover 110-136Mhz where I thing that OFCOM and other regulatory bodies might take a slightly more robust response!

I urge readers to lobby their national authorities over the sale of these largely unlicenceable radios.

For anyone who doesn't know what a JT-208 is, I suggest a general web search.

So long as its perfectly legal to sell stuff like this, we will be plagued with intrusions.

Kind Regards,
Al.

306. Message from PE1RAH about HAMSAT

Yahoo group: eu-amsat
Date: 2005-11-13 02:36:57 UTC
From: William Leijenaar
Topic: 306 Message: 306

Dear EU-HAMSATs,

Today I got an email message from India with the information that my transponder on HAMSAT will be switched on soon.

The switch over from the Indian transponder to my (Dutch) transponder is skeduled on 17th November at 5:00 UTC. When there are no problems it will be kept on for a time period of 4 weeks.

I pass on this information only for ham radio use !!!!
For official anouncements please contact ISRO or AMSAT-India directly.

I just returned from a long time stay in S.Korea, but I will get my station ready to be qrv on the HAMSAT when my transponder is switched on. For those who will make a qso with me via my transponder I will have a special qsl-card.

Tasos (SV8YM) has designed a special QSL-Card for me with exclusive fotos of the HAMSAT and with information about the HAMSAT. These QSL-cards are not only nice for your log, but also nice to see and to know the story and information about HAMSAT.

To see if you can work me, my grid-square is JO31BH
(Lat: 51.300N, Lon: 6.155E)
For any skeds, please send me your email...

73 PE1RAH, William Leijenaar
Designer of the Dutch transponder on the Indian HAMSAT.

307. Dutch transponder switched on at HAMSAT-1

Yahoo group: eu-amsat
Date: 2005-11-17 08:46:27 UTC
From: William Leijenaar
Topic: 307 Message: 307

Hi dear EU-AMSATs,

This morning I was able to hear my own transponder downlink.
Last time I heared it was in India in the thermovacuum chamber, and
later after the launch for a few seconds in space.

This time I could hear it from out off my own radio in my own shack.
Its a funny idea to know that a few years ago the same transponder now
in space was just a few centimeters next to the same radio, under test.

I am happy to anounce that the Dutch transponder is working and
available for all of you. Please listen to the CW beacon on 145.860MHz.

Please also take care of your power. I already noticed that the
transponder got in its limiter because of to high input powers.
When the limiters activate the CW beacon will have also interference,
what is a kind of indication for to high power uplinks.

I hope it will work well for your experiments and DX,

73 de PE1RAH

Hello William & Group,

today afternoon I heard your transponder, during #2.909 orbit of Hamsat.
It was not very good pass for my location (max 14? Elev), but your beacon
was
100% readable ! FB ! Congratulations !

I would like a QSO with you. Just let me know the next possible
passes
which are suitable for you.

309. HAMSAT will soon switch over to the Indian Transponder

Yahoo group: eu-amsat
Date: 2005-12-20 10:54:33 UTC
From: William Leijenaar
Topic: 309 Message: 309

Dear AMSATs,

I just got a message from the India Space Research Organisation (ISRO) that they will switch my transponder of and switch over to the Indian Transponder.

The switch over will be done at December 21 on 4:40 UTC time.

To know what transponder is switched on please listen for the beacon that is active. Each transponder has a different beacon, see below:

Indian transponder - unmodulated carrier on 145.936MHz.
Dutch Transponder - CW message on 145.860MHz.

Many thanks for all your reports,
I hope you enjoyed my transponder in space.

Topic: 314 Message: 314

First off ... MERRY CHRISTMAS to everybody.

It's really good to see several new callsigns
on AO-7 in the last few days ... remember, this
really is THE GRAND OLD LADY of space.

(The IC's used on this bird are components that
have survived longer than any other in a space
environment ... 31 years!).

For those that use this bird, please log your contacts
in the log on the following page ...

<http://www.emilyshouse.com/experthams/ao7/ao7log.php>

Here, you will also find a positive mine of information
about this satellite.

I'd like to take this opportunity of wishing you all a
HAPPY NEW YEAR.

73 John. <la2qaa@...>

315. New information for newcomers.

Yahoo group: eu-amsat
Date: 2005-12-27 17:12:10 UTC
From: John Alan Hackett.
Topic: 315 Message: 315

Hi All,
For those who may be interested, at the following link you will find some useful information aimed at the potential newcomer.

These exerpts are from the book THE BEGINNERS GUIDE TO AMATEUR RADIO SATELLITES by La2qaa and Gm1sxx ...working title: DOGS1 ... 1st edition ... (that means some of the data isn't updated yet) ... we're both extreemly! lazy.

It's in book form so just click on the titles. Drawings and schematics can be obtained by sending an e-mail to La2qaa or Gm1sxx.

<http://freespace.virgin.net/allan.copland01/live/INDEX.htm>

DOGS1? ... aka Satellites for dogs ... think of Wallace & Grommit.

(You can guess who's Grommit.....La2qaa).

73 La2qaa & Gm1sxx.

316. For the newcomers.

Yahoo group: eu-amsat
Date: 2005-12-29 16:12:45 UTC
From: John Alan Hackett.
Topic: 316 Message: 316

For the newcomers ...

Pertinent AO-7 information.

AO-7 was launched in 1974, it "died" in the beginning of 1980 but came back to life in 2002 ... (that's 20 years! being QRT) ... It has been providing providing daily QSO's again for the last 3 years.

Unfortunately, a lot of people arn't aware that this Grand Old Lady of Space is still active.

AO-7 carries a Mode A (145.850-950 MHz uplink and 29.400-500 MHz downlink) and Mode B (432.180-120 MHz uplink and 145.920-980 MHz downlink (inverted)) linear transponders and originally had 10m, 2m and 13m beacons. The 2304.1 MHz was never turned on because of international treaty constraints.

As of this writing ... (December 2005) ... the satellite operates in daytime only from the solar panels.

The transponder turns on randomly between Modes B, C and A. It seems to favour mode B in the winter and mode A in the summer ... (think sunlight!).

Mode C is a lower power version of mode B.

Due to solar panel only operation, QRP levels *MUST* be used.

So what's QRP? ... (all things are relative) ... I regularly work mode B with an *MAXIMUM* EIRP of 30w ... that's 3w to a 10dB gain aerial or 30w to a groundplane ... (don't forget to take into account your feedline losses).

AO-7 is in a much higher orbit than VO-52 and therefore has better coverage and less doppler.

Further technical information can be had at ...
<http://www.amsat.org/amsat/sats/n7hpr/ao7.html>

A new AO-7 acheavement award is planned, to celebrate AO-7's 31st anniversary and to generate more interest in this old but active satellite.

Even the commercial birds don't last for over 30 years! in space ... think about it.

FAIR WARNING.

Don't! expect it to be as easy as working VO-52 ... it's
a "challenge" and therefore more rewarding when you're successful.

73 John. <la2qaa@...>

>
..same problem here John!

Athens is not like... Holland (flat-country), its a place with 4 High
mountains very close to the town (1030m ASL the highest!) so the city of
Athens seems like a big... basin !
(The LOS from Athens happens not at 0? Elevation but much earlier, at 5-10?
depended on bearing.)

I have noticed another problem, some Sat-operators
they don't think that the other station perhaps is outside of Satellite's
orbit
after a ..... "Long-Play" Microphone, precisely because the "window" on the
"other side" station is too short for bla-bla-bla, but high enough only just
for a
typical QSO !
Probably few peoples forgetting that, these QSOs are through a LEO... not
through a HEO satellite !

Finally, I can not understand some others (special category !) operators
which
call me on the same Satellite for .... 4th, 5th (or more) time during the
same week !
I wonder why.... well done the 1st QSO, OK the 2nd for 100%
confirmation...
WHY every day? 1-2 QSOs are not enough for some peoples?
With this action, probably they prevent other operators that have not
spoken
with me (i.e. they need a QSO with SV), especially in case which my
"windows" with Satellites are too short (like yours John).

HNY

320. Re[2]: [eu-amsat] Wonder why?.

Yahoo group: eu-amsat
Date: 2006-01-02 08:20:44 UTC
From: OM0AAO Viliam
Topic: 317 Message: 320

Hello!

I agree with Mak, sometimes is very difficult to complete a SAT QSO. Note that many ops have bad QTH like me, HI.

For example, how I have improved my systems for FO-29:

Begginning:

RX: DL7KM (8dBd) + 8m RG-213 + FT-857D
TX: 2x3el.DK7ZB (5dBd) + 10m RG-213 + TR-751E (25W)
Heard only unreadable sigs

Second epoch:

RX: 13el.DK7ZB (14dBd)+ 8m RG-213 + FT-857D
TX: 2x3el.DK7ZB (5dBd) + 10m RG-213 + TR-751E (25W)
Heard many stations but S-meter shows zero. The receiving system looks very sharp and I have observed that my ERP is low.

Third epoch (present):

RX: 13el.DK7ZB (14dBd)+ 8m RG-213 + preamplifier BF988 + FT-857D
TX: 5el.DK7ZB (9dBd) + 10m RG-213 + TR-751E (25W)
Strongest stations peaking S6 and my own sigs are much better. Receiving is easier and it's not needed to turn it so often.

Fourth epoch (planed):

I would change a preamplifier for a GaAs FET type and put it directly under the antenna.

Conclusion:

Preamplifier for SAT work is absolutly necessary. An ERP above 100W too. Both antennas have a fixed elevation about 15 degrees.

But in my QTH where are 2500m high mountains I have observed that some passes are much better. Audible sigs are from 2 up to 60 degrees of elevation but not all kind of passes. Especially western passes (with elevation lower than 20 degrees) are bad.

So I am understanding this very well...

See you on the sats, HNY

Hans, it is *not* good operating proceedure to call CQ on top of somebody else already calling CQ ... (AO-7 08:55 02.01.05) ... and then whenever the stations QSY's to a clear frequency just following them to continue to call CQ on top of them.

The downling signals were very strong and given the full duplex it would have been impossible *not* to hear the station already calling ... (me). There were plenty of clear frequencies in the passband, the only other station operating within 20Khz was RA3ET.

It's very childish ... if you're shy and don't want to answer the station calling you perhaps a walkie-talkie would be more appropriate?.

323. Elliptical polarisation on LEO's.

Yahoo group: eu-amsat
Date: 2006-01-02 09:41:54 UTC
From: John Alan Hackett.
Topic: 323 Message: 323

Aldert,
I forgot to answer you question re: elliptical polarisation.

Elliptical polarisation is a "combination" of vertical and horizontal polarisation but *NOT* circular polarisation.

Imagine two aerials on a horizontal boom mounted at 45 degrees but at 90 degrees to eachother ... (a common way of mounting aerials) ... but instead of using a phasing harness to obtain circular polarisation you feed them in parallel ...1 aerial delayed by 90 electrical degrees ... you couple each 50 ohm aerial to a phasing line ... (to give 100 ohm) ... then connect both aerials in parallel to get back to 50 ohm. This will give ELLIPTICAL polarisation ... useful and often necessary when one deals with polar propagation anomolies.

REMEMBER! ... circular polarisation can only be truly "circular" in the boresight of the beam ... (this FACT! is very often misunderstood by amateur aerial constructors). ... imagine a satellite over Athens transmitting with a circular polarised beam ...stations in the boresight of that beam will receive circular polarisation ... BUT ... stations at all other angles will receive various combinations of ELLIPTICAL polarisation. It all comes down to spin rate and angles.

Or ... (as they say China) ... "you pay yer' money and you take your choice".

I hope that helps.

73 John <la2qaa@...>

324. Re:Wonder why? (and few strange effects!)

Yahoo group: eu-amsat
Date: 2006-01-02 13:38:19 UTC
From: SV1BSX
Topic: 324 Message: 324

Hi again,

just an additional note, about the particularity of beaming, when a city (like Athens)
is between high mountains:

on North part of Athens is a mountain (named Parnis). Well, this mountain used from
several amateur operators in Athens, as a natural reflector ! And it works !!!
For example, I have a friend of mine outside of Athens (about 70 Km at 80? bearing). Its impossible to have a direct contact on VHF with him, because another mountain (on Eastern part of Athens) is between us and very close to my QTH.
When rotated my Yagi antenna (9 El.) directly to mount Parnis, about 350? bearing (front-side from direct bearing), then is possible to have a good quality QSO with my friend !!! Just by using the North mountain as reflector !
Several years ago, this mountain has been used by a military base of NATO, also as
reflector on microwaves by using metallic-plates, close to the mountain's top. That's why
the first amateurs in Athens they had the same idea, by using not metallic reflectors, but the mountain's surface as a natural reflector on VHF!
Of course, the propagation condition is not stable through this reflection, depend on WX, humidity and other parameters and sometimes the signal has heavy & strong fading.
However, is very interesting and useful effect.

But the most strange and interesting effect, is that which happens on Satellites. When a Satellite comes from South, sometimes is possible to have access into the "bird" by beaming directly to this mountain which is in the Northern part of Athens (exactly in the opposite direction !!!). Believe it or not, is 100% truth !!!

I have several QSO with my antenna pointing at this Mountain, when
the Satellite came from South, then going overhead and finally is setting to the North !!! Without
any movement on my rotation or elevation (stable 360? bearing, 10? Elevation).

Of course, the RX & TX conditions are not stable. Sometimes I can do that, some other times no.

In a chating with few other amateurs here in Athens for that, was said the following theory:

probably, the morphology of the city of Athens with several mountains around and very close to the town, its like a big-big natural "dish" down to the ground. Depended on my "beaming angle" the signal reflected in the mountainside's surface (probably it works like the "receiving angle" of an LNB on TVRO dishes) and re-transmiting up to the sky with high enough beamwidth, depend on the mountain's asperity.
Its a logical explanation, I think.

That is the "good effect"... as Villiam said on a previous message, the "bad effects" on a city
with high mountains around are: non stability on receiving conditions from Satellites, limited "windows", limit accessing at low Elevations etc etc.

I wrote this Email as a note, in order to understand how different, strange and unusual is the operation and the conditions in some locations.

Keep in mind that, may be the "other side" operator through a SAT-QSO is under extremely difficult RX-TX conditions in order to complete a QSO with you... don't make the life of him much more complicated.

Thanks for reading

73, Mak SV1BSX

This must be one of the occassions I must say that I'm glad I live in the flat country Holland.

I must say that I always follow the footprint of the sat, but never think of the fact that receiption could be lost on the other side because of obstacles. Most of the time the first part of the QSO is just the exchange of S/R and locator grids> If I have more QSO's with a station I'll have a conversation about others things and then there is always the possibility that there is no answer when I stop talking.

On the other side guys, bear in mind that we're talking about full-dulpex sat operaration so it's not so difficult also to say that you're loosing sat or just end the QSO after exchanging the essentials for the QSO.

Nevertheless I think it has nothing to do with inpoliteness, but unawareness of the person talking a long time.

Mak, the fact that some operators call you for 4th,5th etc time must be because you're a nice guy to talk to. Since you're not in for social talks I will not call you when I hear you on freq. Not even to say goodbye. Just kidding, I know that you mean that for many it is interesting to work you, but they are not given the oppurtunity as others keep calling you.

For me it's different Mak I appriciate to say something else then only cq.

Correct Mak,
Yes, mountains can sometimes be a hindrance but not always.
Another useful feature is knife edge propagation ... (particularly on microwaves) ... this can be seen by a small experiment.

Place a piece of cardboard on edge on a non-reflecting surface ... (not shiny, like a polished table) ... and shine a concentrated beam of light toward the upper edge of the card. By looking at the other side of the card you will see the light dissipated at varying angles with the *"signal strength" decreasing logrimithically with the angle.

Light? ... radio waves? ... same thing!.

You also mentioned a *dish* composed of mountains forming a dip in the natural surface of the earth. This is how the Arecebo dish ... (Peurto Rico) ... radio telescope works. It's a natural parabolic reflector enhanced and "smoothed" by some human concrete ... (as you know, the reflector inaccuracies must be less than 1/10th wavelength for an efficiency of 55% on the frequency of interest).

Also be aware of the phenomonen antipode propafgation ... occa sionally, it's possible to hear a satellite when it's on the "exact" opposite side of the earth to your QTH ... the antipode of your QTH.

I experience a lot of interesting polar propagation anomolies north of 63 degrees lattitude but on the other hand, I can't work things like the ISS due to my lattitude.

John.

Thanks for the reply, but I still don't get it completely.

"Imagine two aerials on a horizontal boom mounted at 45 degrees but at 90 degrees to eachother ... (a common way of mounting aerials) ...
but instead of using a phasing harness to obtain circular polarisation you feed them in parallel ...1 aerial delayed by 90 electrical degrees ... " I reckon that also can be achieved by placing 1 driven element 1/4 wavelenght from the other.

I guess where I go wrong is the coupling of "each 50 ohm aerial to a phasing line ... (to give 100 ohm) ... then connect both aerials in parallel to get back to 50 ohm". Could you explain this a bit more. Normally you feed the two antenna through a splitter made from two 75 ohm quater wavelength coaxcable. Could you explain how the feeding and with what coax this system is done. With circulair you have right hand and left hand circulair antenna's. With these elliptical polarised antenna's, wich way should you feed the 2 driven elements or can you obtain also left and right (or whatever it is called)

Thanks professor for the reply. You're not that senile as you pretend to be.

Aldert

From: John Alan Hackett.
Topic: 323 Message: 331

Ah! yes Aldert,
That's easy! to explain.

I was editing the mail with the cut and paste technique ... and pasted part of it in the wrong plce! ... without noticing the mistake.

You're absolutely right! ... what I described about the 90 degrees offset *will* give "circular polarisation" ... left or right, depending on which aerial is lagging by 90 electrical degrees.

This bit was meant as an extension "AFTER" the circular polarisation paragraph ... and *NOT* as part of the elliptical paragraph.

If you don't believe I'm completely senile now, there's your proof!.

(ha-ha).

Here's the correct version:

2 x 50 ohm Z aerials, each with a matching stub to 100 ohm. The aerials mounted at 45 degrees on the crossboom, 90 degrees to eachother and fed in parallel through a T-connector. This will give elliptal polarisation.

To put it another way ... sometimes the satellite's transmit polarisation will be predominantly vertical, sometimes horizontal ... almost never circular (!) ... unless it's pointing *DIRECTLY* at you (seldom) so elliptical is a better "compromise" for LEO's with it's 50% GAURANTEED correct polarity as opposed to a possible ... (worst case scenario) ... of -30dB loss due to incorrect (opposite) polarity.

NOTE.

We're talking about LEO's here ... the story changes with medium and high orbits like Molniya's.

I hope that corrects my "UNFORGIVABLE" error ... and for your your information, I *AM* old, bald and senile ... ha-ha-ha.

FROM LA2QAA's USELESS INFORMATION ARCHIVE.

Somebody once asked me how you find the orbit of a satellite if you don't have a computer.

In the old days we used an OSCARLOCATOR ... but that's obsolete these days.

The modern man ... assuming he knows a bit about celestial mechanics ...(the movement of the earth, to you!) ... can do it by using nothing more than his morse key ... sorry!, microphone ... and a calculator.

By sending a pulse to to a known satellite then measuring the time it takes before he hears the returned signal ... (and knowing the speed of light) ... then dividing the time by 2 ... will have found the current range of the satellite at that particular epoch.

If he does this frequently over the course of several days, together with a knowledge of the earth's movement he will then be able to plot the orbital parameters.

This (in reverse) is basically how a GPS receiver plots your position.

You did! know that, right? ... of course! you did.

Topic: 323 Message: 337

Hi folks,
Polarization of antennas is a very interesting and sometimes difficult case,
so just few additional "tips" from me.

In order to undestand right the relationship between Linear, Circular and Elliptical
polarization, is necessary few words about the theory... so:

**Theoretically, linear and circular polarization are special cases of elliptical
polarization.
Consider 2 eletrical vectors at right angles to each other.
The frequencies are the same, but the magnitubes and phase angles can vary.
If either one or the other of magnitubes is zero, under this condition the polarization
is LINEAR.
If the magnitubes are the same and the phase angle between the 2 vectors
(in timebase) is exactly 90 degrees, under this condition we have CIRCULAR polarization.
Any other combination between these two limits gives ELLIPTICAL polarization.***

From this theory, if we talking for Circular polarity is obvious that,
its easier to achieve.... Elliptical polarization, than the wanted Circular !
Is high enough just... a small fault (incorrectly phase stamp, bad matching etc)
as the Circular polarization happens only when the two electrical vectors
have 90? difference in phase, all the rest cases give Elliptical and Linear polarization!

>
> "Imagine two aerials on a horizontal boom mounted at 45 degrees but
> at 90 degrees to eachother ... (a common way of mounting
> aerials) ...
> but instead of using a phasing harness to obtain circular
> polarisation you feed them in parallel ...1 aerial delayed by 90
> electrical degrees ... " I reckon that also can be achieved by
> placing 1 driven element 1/4 wavelenght from the other.
>
>

In practice, the necessary phase's difference (90?) in our antennas
is possible to achieve with two common methods:
Electrical & Physical.

1)Electrical:
by adding an Electrical-length "Quarter wave" coaxial
(e "Lampda/4")
which acts as "delay section", in series with first (or second)
antenna-feeder.

Supposing that, we have two Cross-Antennas, the No1 and No2.

If the No1 antenna-feeding is delayed in Phase by 90? from No2 antenna,
this system generates CW Circular polarization.
The opposite polarization (CCW) happens If the No2 antenna delayed in
Phase by 90? from the No1 antenna.
However, if the 2 antennas are not exactly 50 Ohms or they have strong
enough
inductive or capacitive behavior (+j / -j), then the overall feeding
system
(spitter + phase stub) is possible to occur serious problems in the antenna
feeding. For example, the feeding is not equal between the two antennas.
If we have unequal power-feeding in two crossed-antennas, the polarization
is 100%
Elliptical !
(absolutely unwanted effect!!!)

2)Physical
In this case we don't need electric-delay like a Lambpa/4-coaxial,
but the Circular polarization can
be achieved
by "sliding" (shifting) forward the No1 from No2, a "Quarter-Wave" space
in order to be able the necessary
difference in phase. But, that is possible
ONLY when the Elements of both crossed-Yagis are into the same (common)
Boom.
Advantage: Simplest and very accurate method. Without "delay-phasing stub"
in series with coaxial's splitter, the power-distributing on both antennas
is
EQUAL from
splitter, regardless of SWR.

(for more info take a view in this Group into FILES/Satellite
Antennas/circular-polarizitaion.pdf {Including an excellent article about
this method by OZ2OE})
http://groups.yahoo.com/group/eu-amsat/files/Satellite%20Antennas/

> I guess where I go wrong is the coupling of "each 50 ohm aerial to a
> phasing line ... (to give 100 ohm) ... then connect both aerials in

> Normally you feed the two antenna through a splitter made from two
> 75 ohm quater wavelength coaxcable. Could you explain how the
> feeding and with what coax this system is done. >
>

Before anything else, just keep in mind the following
"Quarter Wave" formula (the "magic formula"!) :

* ***********
Z = * * (Z1 * Z2)
*

(Z1=SQUARERoot Z1 * Z2
[sorry for graphics, keybords have not symbol for square root!])

Scenario: we have an antenna with Z=100 and we want to connect it with a coaxial 50 Ohms.
Is it possible??

Yes, by using a piece of coaxial cable which acts as a kind of Z-transformer (matching
stub).... but what kind of coaxial is that in order to "match" differents "Z" ?
How many Ohms must be the impedance (Z) of it ?

For the solution, we using the above formula... (Z= SquareRoot Z1*Z2)

Z is the wanted (unknown) "Z".
Z1 the antenna's impedance (100 Ohms)
Z2 the known Coaxial impedance (50 Ohms)

I solve the "magic formula", so we have:

* ***********
Z = * * 100 * 50 => Z=70.7
*

Voila ! The result is about 71 Ohms ! Hmm... Seems like the known impedance of RG-11 !! Yesss!

So, by adding a "Quarter Wave" 75 Ohms Coaxial cable between 100 and 50 Ohms impedances is possible to "matching" these 2 different impedances of 50 & 100
Ohms).
So simple !

May be you thinking that, the RG-11 is 75 Ohms, not 70.7 Ohms, so it is not good enough.
Yes, right, but the missmatch is very-very low, so just forget it. In practice the matching
between a 100 and 50 Ohms impedance by using 75 coaxial cable is almost perfect!

The "splitting" in case of 2 "crossed yagis" for circular polarity following this method with just
the opposite edge's impedance termination from above example.

We have two antennas of 50 Ohms. By using a "Quarter Wave" matching-stub (75 Ohms)
on each one 50 Ohms antenna, we have on the "free" (opposite) edge of each one coaxial an
impedance point with Z=100 Ohms.

If two impedances of 100 Ohms connected in parallel (T-point)
from No1 & No2 antennas, we have 50 Ohms (100/2=50) .
That's all ...!

Note: these 75 Ohm "matching stubs" are always ELECTRICAL(e) "Quarter
Waves".
"Electrical Quarter Wave" means the physical Quarter Wave (Lampda/4) by the
VF (Velocity Factor) of coaxial cable that has been used. (ie for RG-11 the
VF=0.66).
At 145.9 MHZ (satellite subzone) the Lampda/4 = 51.4 cm... so the e*Lampda/4
is:
0.66 * 51.4 =33.9 cm (or 339 mm).

Finally, if the length of a "matching stub" is too short between antenna's
connector
and 'T" point, is possible to multiply that but ALWAYS with an ODD number
(1,3,5 etc)
in order to take enough length of coaxial, for connection between antennas
& T.

NEVER, I repeat NEVER by EVEN multiplier... that because in this case the
Lampda/4 is not any longer
"Quarter Wave", but... "Half Wave" (Lampda/2) if multiplied x2, "Full Wave"
(Lampda) if multiplied x4... etc!
Absolutely different thing from Quarter Wave !
(That because on Lampda/2 the phase difference is not 90 but 180?, so that
is not
under wanted quota of 90? which has the Lampda/4-phasing stub.)

That's all folks... I hope that helps you and sorry for my bad english, but
I'm Greek!

dr Albert,

I don't agree 100%... full-duplex in Satellites is not a "pure" full-duplex operation, as for example on the telephone-line. In this case if you can't hear your interlocutor, you can say to him in real-time "I can't hear you"....
and he will hear it that instantly.
On Satellites that not happens. If the satellite is almost out of my range (near to LOS)
and the other stations talking for 1-2 minutes (bla-bla-bla-bla), I've just one possibility:
an effort from my side for "cross-talking", hoping to hear me (the other station) on Downlink, together with his voice... if this happens then probably I will tell to him:
"sorry, I can't hear you now, the Satellites going to my LOS, I can't hear you any longer".
OK, that is the ideal case.

But, if my downlink is very weak because the Satellite is under difficault angle, how
is possible to do that?
That's what I mean my friend.

>
>
>Mak, the fact that some operators call you
>for 4th,5th etc time must
>be because you're a nice guy .

do you think? Unfortunately I've not yet any invitation from... Hollywood's "Star system" !!!
(but I'll hope for that after your comment!)

>Since you're not in for social talks
>I will not call you when I hear you on freq.
>Not even to say goodbye. Just kidding, I know

>that you mean that for many it is interesting to
>work you, but they are not given the oppurtunity
>as others keep calling you.
>
>For me it's different Mak I appriciate to say
>something else then only cq.
>
>73's
>
>Aldert
>PH7PCF

dr Albert,

I have no problem with "social talking" and also I would like to talk on SATs, but if
the time is enough (like HEOs) and the Satellite has low traffic. As I said before, for me the time is not enough on
LEOs, due to short "mutual windows".

On the other hand, I like very much the DX-ing and I have about.... 50000 QSOs on HF
and 301 confirmed countries. I'm not a QSL-collector any longer, so the "CQ" and "59" is not the only one interest for me on Satellites (if that was innuendo about me)... it is not my problem to collect few additional QSL cards through Satellites from neighborhood countries, I have enough cards in order to stoke my... fireplace for the next 10 years!
BUT, if somebody call me every day on the same Satellite and he talk to me between my AOS upto my LOS, that's a problem for me my friend. Is very bore for me! Sorry but that is not a "social talk", definitely.
Especially when the same time I hear other stations which call me and is impossible to answer, as my "window" is too short and a "blablabla-er" makes my
day bad. Really, sometimes I feel so saddness for that. That's I mean.

However, no problem at all dr Albert. Being Greek, I sustain always one of the basic rules of Democracy:

** I disagree with you, but I will support your right
to have a personal and independent opinion, and definitely
I will respect your concept, even in the case where is completely
different of mine.***

339. Z matching.

Yahoo group: eu-amsat
Date: 2006-01-04 21:21:24 UTC
From: john hackett
Topic: 339 Message: 339

Perfectly! correct Mak,
In fact you can use the varying impedance and
"electrical lengths" of good conductors to match almost any impedance to any other ... it doesn't necessarily have to be coaxial cable. When you get into the realms of microwave radar, conical, slot and and lens aerials ... (like in the nosecones of fighter planes) ... impedance matching becomes a fine art.

In the old days I used to use a 4 element homebrew electronically switched vertical phased array on 15m and the matching system was a sight to behold! ... hi hi.

I later rescaled this design for 70cm as a satellite array and put it in The (USA) Amsat Journal. It was a lesson in phasing and matching.

Probably a bit too complicated for the reflector generally but I might get round to putting it into the "files" section one day. Actually, I think it may already be in DOGS! ... (I can't remember).

I cut my teeth ... (grew up) ... with Wilkinson power dividers and Pewsey stubs in The Royal Signals.

As you know, many aerial manufacturers deliberately "stretch" the truth ... to sell their products.
Unfortunately, a lot of people believe everything they read and after it's passed a few mouths it becomes a FACT! ... hi hi.

Here's an example ... (from my army days) ... of the story changing by being "passed along".

Operator 1: "Send reinforcements, we're going to advance".

Operator 2: "Send three-and-fourpence, we're going to a dance".

These days I tend not to get involved in aerial discussions because unfortunately there's a lot of rubbish ... (misunderstandings) ... especially on HF with some of the "magic" aerials ... (hi) ... where certain people attempt to change the laws of physics to fit their aerial designs.

As you know Mak, the laws of physics *don't* change ... but various other parameters often do.

I knew! I was right when I wrote ... "Mak understands".

340. my usual wee rant

Yahoo group: eu-amsat
Date: 2006-01-05 08:20:37 UTC
From: Piero Calvi-Parisetti
Topic: 340 Message: 340

Dear all,

I have not joined this mailing list a week that I am here already talking about my (and many others') frustration with the lack of information about P3E.

Some of you may perhaps remember the post I made on the amsat-bb list a couple of months back, *after* having given my small financial contribution to the project.

Then, in explicit terms, I declared my respect and admiration for AMSAT-DL, but at the same time I said that I found it incredible that the amateur satellite community is left completely in the dark as to the progress of the construction, the testing, the problems encountered/solved and - most importantly - the prospects for a launch date. Even more incredibly - I think - we are asked to contribute to what is likely to be a very expensive undertaking without the smallest piece of financial information.

My post generated a couple of very supportive private replies from old hands in the trade and a few replies on the BB generally agreeing with what I said. Period.

What can we do to put friendly pressure on AMSAT-DL to be less stingy with information?

Hi Piero.

Its quite normal for information on planned satellites to be sparse.
In part I think its because the designers and builder have more
important concerns than the PR side of things.

You can find some information at..
http://translate.google.com/translate?hl=en&sl=de&u=http://www.amsat-dl.org/p3e/&prev=/sea
rch%3Fq%3Damsat%2Bp3e%26hl%3Den%26lr%3D%26sa%3DG
(if this does not print properly... try the AMSAT DL-Website) where
you can find some information.

With project management generally, nothing seems to happen for a long
time then just when you think it's all about to go horribly wrong,
things sometimes get delivered on time... or almost on time.

The point I'm making is that there's a lot more to satellites (and
other large projects) than the physical item. There's a lot of
paperwork too.

Don't get discouraged.

From: ph7pcf
Topic: 323 Message: 343

Thanks Makis,

Ok it's quit clear to me. Practically I guess you can use the Z-transformer discribed on your page

http://www.qsl.net/sv1bsx/gammadip/collinear2.html

I have just a couple of practical questions:
1) Is the lenght of coax between D1 and D2 and the Z-transformer critical by way that it should me a number of 1/4 wave 50 ohm line or should it be just equal parts;
2) I assume that like circulair antenna's, you can make a REP (right elliptical polirased antenna) and a LEP (left elliptical polarised antenna). Wich one is the best one to use for LEO sat's;
3) As you can make LEP and REP, there should also be a possibility to combine all the polarisations together in a switchbox so you can switch between Hor,Vert, RHCP, LHCP, Diagonal 45 deg and Diagonal 135 deg. Do you know if that's been done and is there by any chance a link on the web?

From: john hackett
Topic: 344 Message: 344

SATGEN from 2001.

Recent developements including scores of University and Academy launches , plus AO40, have been an enormous disappointment.

(Note the following FACT ... La2qaa).

With the whole complement providing less communications than a single RS12.

Meanwhile reading the pre-election notes of candidates for the Amsat Board reveals no apparent concern at this decline.

Once touted as the comms media for the world, Amsat is declining into a mere footnote in the history of Amateur Radio ... and would be Board members appear not to have noticed.

GM4IHJ (SK) endorsed by La2qaa.

NEGATIVE! This technique is lightly different Albert. It's more complicated
and
has additional solders & connections between the coaxial's pieces.
I followed this technique just because the dipoles have a
piece of coaxial in order to construct the Gamma-match. However, in this
case the coaxial (Z1 on my pictures) between Gamma and Z-TR is Lampda/2
50Ohm coaxial (or 2*Lampda/2= 1 Lampda, has no any difference) in order to
keep the VSWR stable, but it is not a matching-stub.
The matcing from 50 Ohms to 100 Ohms becomes from the Z-TR coaxial piece,
which is 75Ohm e*Lampda/4 (e=electric). The two "Z-TR" are the
"matching-stubs" !
So you don't need to follow this technique, but put directly 1*eLampda/4 or
3*eLampda/4
or 5*eLampda/4 (75Ohm Coaxial) from each one antenna, upto "T" connector,
depend on necessary "spacing" between each one antenna and "T".
Works just the same but is a simplest one method.

>
>
I think my friend, you are ...."in love" with Elliptical polarization! Can
you explain me WHY, please? Elliptical is "OUT OF USE" !
On Satellites we use mainly CIRCULAR polarization. Due to AMSAT's standards,
the polarity is CW (or RHCP =Right Hand Circular Polar.)
Sometimes, on LEOs Sats, because the spacecrafts are close enough to the
Earth, they
have spin, they mooving fast, we have also the Farraday effect etc. etc.

etc., sometimes-
not always, sometimes the polarity is possible to be changed randomly. But that is not a problem on receiving,
because the LEOs are close enough and they have strong enough signals.... it is not like a HEO... 60000Km far away and almost "stable" in the space, like the "dead" now AO-40 which was very weak and the polarity was too much important case for the best signal. So just forget it that on LEOs. Use CW polarity and "you are the champion"... that's all.

Keep in mind that, the main problem is the opposite polarization. Nothing more.
For example, if the SAT has CW and you have CCW, the loss is -30 dB.
Also on ground stations the loss between Vertical & Horizontal pol. is also -30dB.
BUT, between CW or CCW and Vertical polarity, the loss is ...only -3dB !
That explains how is possible several stations, they can work Satellites by using
Linear polarity ! Of course, they have -3dB loss, OK. But on the other hand they using
just the ..same antennas with ground stations. About the -3dB loss ???
Hmmm...who cares for just -3dB , if they have the simplicity of a Linear antenna? I believe... nobody !
(I'm also one of them!)

>3) As you can make LEP and REP, there should also be a possibility

>switch between Hor,Vert, RHCP, LHCP, Diagonal 45 deg and Diagonal
>135 deg. Do you know if that's been done and is there by any chance
>a link on the web?
>
...I've no idea about REP and LEP but definitely, they exist few diagrams on Books for "switchable polarization" by using 2 crossed Yagis. These systems offer RHCP, LHCP, Vert & HOR polarization. Nothing more.
I don't suggest you that because a similar switchable system needs high enough experience
in the homebrewing, as including a large number of "phase stubs" which sometimes are difficult constructions. Don't forget, if a "phase stub" is fault,
the necessary phase-difference can vary far away from 90?, and that is very-very bad
story for the final result on a similar antenna-system.
Additional, a similar system especially on UHF band needs Hi-Quality (silvered) Coaxial relays with the respective N-type connectors in order to keep the losses as low as possible on UHF band, and here we talking for... expensive pieces! And you need several of them, with the necessary "control box" into Shack etc.
However, if you have still interest about, I have a drawning with an arrangement for crossed Yagi's feeding which provides various polarizations.
Just let me know.

347. RE: [eu-amsat] FO-29: take "two" !

Yahoo group: eu-amsat
Date: 2006-01-07 09:13:20 UTC
From: john hackett
Topic: 345 Message: 347

Hello Mak,
Thanks for the information re: FO-29 but my DX chasing days
are long! gone.

The only award I value highly is my QRP 2w ... (all CW) ...20m DXCC ...
(best DX = ZL) ... I didn't even bother to apply for several others ...
(though I have the actual QSL cards to "prove" the contacts) ... CW, RTTY
etc ... this was HF of course ... (25 years ago).

In the early 90's I used to work predominantly on FO-20, with Japan every
morning and The USA, Alaska and Canada every evening. AO-10 and AO-13 gave
me all the DX I ever needed. These days I just prefer relaxed contact with
whomever happens to be on at any particular time ... just lazy! I guess Mak.

I don't have any "wanted" countries at all. If we ever get a P3E I'll
probably bump into Alain and Dimitri but I'm much too lazy to go chasing
other stations Mak. If it happens it happens, if it doesn't, no problem.

73 John.

348. Elliptical polarisation on LEO's.

Yahoo group: eu-amsat
Date: 2006-01-07 09:27:09 UTC
From: john hackett
Topic: 323 Message: 348

Hello Mak,
I fear Aldert may have possibly misunderstood what I told him
about elliptical polarisation.
I have since had a *LONG* chat with him on Echolink and explained things in
more detail.

The fact of the matter is ... as you correctly state, the polarisation
RECEIVING a LEO satellite doesn't make a scrap of difference! in practical
terms for COMMUNICATION ... unless you have the opposite sense of CIRCULAR
polarisation ... which is what you said, that's correct.

The other point to bear in mind is that the polarisation from a TRANSMITTING
antenna is only truly circular at the ZENITH of the beam ... in all other
directions it will be either horizontal, vertical or elliptical CONSTANTLY
CHANGING ... depending on the spin rate and the orientation of the satellite
at any particular time relative to the RECEIVING station.

Two other points to consider ... two stations seperated by more than 500Km
hardly ever! receive exactly the same signal (see above) ... as well as
natural propagation phenomena in different locations.

I also explained about the BMEWS radar effects on AO-7 over the Greenland
Icecap ... Allan and I did extensive work on this a few years ago).

73 John.

349. Europeans on AO-7.

Yahoo group: eu-amsat

From: john hackett
Topic: 349 Message: 349

Worro! Chaps,
It's been said by some of those guys on the other side
of the pond ... (Americans) ... that the EUROPEANS are not very active on
AO-7.

The statistics tell a different story ...

LA2QAA ... 1st placed European.
G1WPR -... 2nd placed European.
PA0HOP ... 3rd placed European.
ON2AFC ... 4th placed European.
PH7PCF .... 5th placed European.

The last time I checked ... Norway, The UK, Holland and Belgium were *all*
in Europe.

Seriously, I'll try to place the proverbial well aimed boot ...(up the bum)
... and see if it can help to generate a bit more interest around the East
coast "over there".

Joe SZH seems to be the only American station interested in traversing the
pond these days.

NB. The current statistics ... (of those that log on) ... can be seen on the
log page at ...

<http://www.emilyshouse.com/experthams/ao7/ao7log.php>

350. Phased Arrays.

Yahoo group: eu-amsat
Date: 2006-01-07 19:58:18 UTC
From: John Alan Hackett.
Topic: 350 Message: 350

Hello Folks,
The 7Mb zipped file I originally attached was probably
too large for the reflector so my mail bounced back.

Here's the original mail. Anyone interested in further details can
contact me and I'll send the file by other means.
.....

PHASED ARRAYS.

Those amateurs seriously interested in phased arrays ... (please
note the word "seriously") ... will know that the BMEWS ...
(Ballistic Missile Early Warning System) ... radars operate on the
principle of electronically switched phased arrays.

Many years ago I got tired of my common or garden variety rotor
becoming a block of ice in the winter and decided there must be a
better system. Having been trained in the use of Taurus sub
reflectors in front of switchable multiple LNA's feeding parabolic
refelectors I decided to try this system for tracking amateur
satellites.

It worked, albeit poorly ... covering less than 90 degrees ... (at a
push) ... in the horizontal plane.

Considering the problem, I remembered that 25 years ago I used to
use an electronically switched phased array on HF that covered 360
degrees with a fair amount of gain. The great advantage being that I
could turn the beam a whole 360 degrees in 3 seconds (!).

Consequently, I used the same principle to design a 70cm
electronically switched phased array for LEO's.

Those with digital electronic skills would have no problem
redesigning the phasing system and getting the electronics to
increment scan varying azimuth and elevations ... (this is
precisely! how the BMEWS radars operate).

Horizontal beamwidths and vertical radiation angles can both be
implimented by the use of a combination of element lengths and
phasing ... however ... BE WARNED! ... the slightest mismatch
ANYWHERE in the system will result in a failure to acheave the
desired result.

The revised article, from the September/October issue of The 1998
Amsat Journal is attached as 6 x zip files ... (total 7Mb) ... this
is because LA2QAA is as thick as two short planks! when it comes to

computers and doesn't even know! how to make a pdf file.

For those not being able to receive such a large file, beg, borrow or steal the old Amsat Journal.

From: ph7pcf
Topic: 353 Message: 353

Nice initiative I must say to let the kids working via sat.

This evening I let my daughter working AO-51. In 2 passes she made 8 QSO and I must say that some amateurs really made an effort to let her enjoy the QSO's. On the other hand my daughter is only 8 years old, doesn't speak english (her dad also) so she had to keep it to the 3 lines I wrote down and wich we practiced.

QSO's were made with EX8MLT, UR4LRH, DL3JIN, M1CUE, PD5DJ, OK2FRP, CT1BGE and 2E1HKC. Her QSO with Paul OK2FRP was even mentioned on the DX cluster by Mak. Haha it was my daughter who made the QSO with OK2FRP Mak. By the way congratulations with your QSO with NA1SS.

This is really an interessing way to get kids interested into amateur radio.Unfortunately I did not hear any other kids on AO-51. When I showed my daughter on the map to wich countries she had been talking to, her eyes became a bit larger hihi.

From: john hackett
Topic: 357 Message: 358

Mak,
You can always check which mode AO-7 is in by looking at the last few QSO's at The AO-7 Resource Page.

Remember, the mode chosen is random but it seems to favour mode-B in winter and mode-A in summer ... note also that the satellite doesn't always stay in the same mode all day.

From this and other of it's peculiarities we can assume it's a female! ... (Don't shoot me Emily, I'm only the messenger).

73 John.

359. Eclipse and mode changes on AO-7.

Yahoo group: eu-amsat
Date: 2006-01-12 20:03:16 UTC
From: John Alan Hackett.
Topic: 359 Message: 359

First of all, AO-7 will *not* be in eclipse for some considerable time.

Long time users will already be familar with the apparent random mode changes.

The more recent operators may not be familiar with all the idiosyncracies of this particular satellite.

Most operators know that some of the switching circuits failed a long time ago ... but they didn't all fail.

When the satellite is in mode-B excessive uplink power causes the satellite to switch to mode-C ... which is a lower power version of mode-B ... (now approximately 400mW) ... making it more difficult to work the satellite.

It had previously been speculated that the mode switching was completely random, due mainly to the amount of sunlight the satellite was seeing. However, in this particular period of time, now that it's never in eclipse ... and the mode still changes ... it suggests that the mode-B/mode-A change may also be power related.

Though the mode-B beacon transmits incorrect frames of telemetry it does! transmit ... and this can be used as a power reference.

The majority of operators prefer to use mode-B, therefore it's IMPERATIVE! to reference your downlink to the beacon and not to transmit with more uplink power than is necessary to communicate.

The same rules apply to AO-7 as to other satellites. If you can't hear your own downlink but you see from the log that other operators are having QSO's ... improve your receive capability.

PLEASE REMEMBER ... AO-7 is a QRP satellite ... a low power satellite is better than no satellite at all ... don't be a power hog and spoil it for the other operators ... please!.

365. AO-7 User Guidelines.

Yahoo group: eu-amsat
Date: 2006-01-13 08:24:15 UTC
From: John Alan Hackett.
Topic: 365 Message: 365

User Guidelines

AO-7 is a tough old bird, but it does have some weaknesses. Those of us who use her respect those weaknesses, and in many ways we feel a special communial bond, much like Leopold's quote. It is important for all who use AO-7 to realize that the greatest risk to successful operation is using excessive power.

Here are some general guidelines that should help you make the most of AO-7:

Use efficient antennas with receiver pre-amps. You should be able to hear very weak signals without needing a lot of power. This isn't UO-14 and power will not be an advantage - in fact it will be a disadvantage.

Keep your power low. Generally you can work AO-7 on 5 watts or less. You may need to increase power if it is at a distance, but be sure to reduce power as the satellite approaches.
Keep your power low, especially in Mode B. Currently AO-7's mode B uplink is in the middle of the 70cm weak signal band. Excessive power may interfere with other services in that band, and may be considered a spurious out of band emission.

IMPORTANT!.

Listen for FM from AO-7's transmitter. If you hear your signal FM, you are putting too much power into the bird. Reduce power and the situation should correct itself.

Keep to the middle of the passband. The strongest signals are in the middle of the passband and you will need less power to hear your downlink.

Use CW if possible. CW strains the power system on AO-7 the least.

Frequency and Mode Information.

Mode-A: / Mode-B:
Type: 2m to 10m non-inverting translator

Type: 70 cm to 2m inverting translator

Mode-A. Uplink: 145.850 to 145.950 MHz CW/USB

Mode-B. Uplink: 432-125 to 432-175MHz CW/LSB

Mode-A. Downlink: 29.40 to 29.50 mHz CW/USB

Mode-B. Downlink: 145.975 to 145.925 MHz CW/USB

Beacon: 29.502 Mhz CW Telemetry

Beacon: 145.9775 MHz CW Telemetry

Additional Beacons:
70cm: 435.1, 850hz FSK TTY
17cm 2304.1 - Disabled

Additional Modes
Mode C: Low Power (2W) version of Mode B

Topic: 366 Message: 367

Hello John ,

tks for info, also K3SZH from PA (FN10OG) is interested from overseas QSOs.

I had a chat with him on ON4KST's chat-room about the possibility for a QSO between US-SV
"over the pond" via AO-7.
Extremely difficult... but I will try it ASAP. I wait for better WX conditions and then I will
climb in the East of Athens mountain (900m ASL), in order to have good access into AO-7 at 1-3? Elevation.
I'm not sure 100%, I think that will be the 1st QSO between US-SV via AO-7 (of course in CW mode!)
Proposals about small, portable antennas for 10m Downlinks (if AO-7 is QRV on Mode-A)
are welcome.

Topic: 363 Message: 369

George,

Yes, you have right 100% ! NOVA with FodTrack has this problem. I don't know
what version you have, I'm using the 2v1 version and yes, I had also this problem.
If your rotator has "termination switch" to North, a simple solution is :
just "turn" your antenna system (rotator's base) in the opposite direction
(by 180?) in order to be able to terminate your antenna system to SOUTH
(and not to the NORTH as happens now).

Of course, if you want to keep in use your OLD Azimuth control for "Manual operation",
that's a problem because in case you have a difference of 180? in Az-meter,
your antenna will pointing to the opposite direction from the Azimuth
read-out ! (ie readout =180? => antenna = 0? /// or readout=90? =>
antenna=270? etc).

If the Azimuth-meter is Analogue coil-meter, no big problem. Just a new "label" with
new bearing-values must be printed (that I did also). But in case you have
a DVM (Digital Volt Meter) readout, its obvious that you have definitely significant problem,
as the "0" Volts is in South, +1.8 Volts in North and +3.599 Volts again
directly to South (at 179?) !!!
Precisely opposite from that which needs a DVM !
It's a really difficult problem that, I have not any solution to suggest
you (if you find something - let me know!).

On the other hand, I had read a similar post in Amsat-BB several months ago. An American
user of NOVA he had written that, the version 2v1 of NOVA is not unique (depended on
download's epoch)! As he wrote, he has a version without this problem ! I
don't know if that is truth... I tried also with latest download-version,
but the problem remains just the same.
NOVA needs 0 Volts direct to SOUTH ! Nothing changed to me !

However, the original Fodtrack-program (written by XQ2FOD I think, for DOS O/S)
including the necessary "config" file in order to put the "termination point" in NORTH
or alternative to SOUTH!
That's great, but it happens only in case where you run the "original"
DOS program, not NOVA.

I hope that helps you. If you want any additional info, just let me know "off" the list.

73, Mak SV1BSX

Hi all,

AO-7 Mode changes in the last 7 days.

Date. Time. Mode.

09 Jan 08:30 mode-A
10 Jan 08:30 mode-B
11 Jan 08:30 mode A
12 Jan 08:30 mode-B
13 Jan 08:30 mode-A
14 Jan 08:30 mode-B
15 Jan 08:30 mode A

This suggests that the 24 hour timer *is* working.

Why? ... I need the circuit diagrams to answer that ... watch this space ... (pun intentional).

73 John.

Very interesting stuff, John. In fact, I also seem to have noticed that the bird is more often in mode A than it used to of late. Keep us informed of progress in your research. 73 Piero >-- Original Message -- >To: eu-amsat@yahoogroups.com >From: "John Alan Hackett." >Date: Sun, 15 Jan 2006 10:42:35 -0000 >Subject: [eu-amsat] AO-7 Mode changes. >Reply-To: eu-amsat@yahoogroups.com > > > > > > >Hi all,

372. AO-7.

Yahoo group: eu-amsat
Date: 2006-01-16 11:16:31 UTC
From: john hackett
Topic: 372 Message: 372

Hi All,
Perusing the various reflectors, it appears that there may be some confusion as to the mode changes on AO-7 lately.

According to tabulated data the satellite will not be in eclipse again until at least March 2006.

Monitoring the last 7 days suggests that the 24 hour timer is operating as it was designed to do ... (31 years ago!) ... that is to say, it's changing modes from mode-A to mode-B every 24 hours at approximately 08:30 UTC.

Points to ponder ...

Hitting AO-7 with too much power *will* ensure mode-B changes to mode-C ... (a low power version of mode-B) ... which transmits with approximately 300 - 400 mW only.

CW should be used whenever possible ... (for obvious reasons) ... AO-7 is a QRP satellite.
SSB should be used at sensible power levels ... enough to communicate, no more.

Recommended power levels (and modes) can be found at ...

<http://www.emilyshouse.com/experthams/ao7/ao7log.php>

By clicking on the various links you will find everything you need to know to successfully operate via AO-7. Emily has kindly provided a new link to help you understand the eclipse situation.

Remember! ... a solar powered satellite ... (no batteries) ... is better than no satellite at all.

Any "new" information will immediately be posted on the EU-Amsat reflector.

Strange that no-one at AMSAT has woken up to the fact that many of these 'me-too' satellites use amateur radio frequencies on what are essentially commercial missions. Could I suggest that financial cost of the radio spectrum has much to do with this choice?

Getting back telemetry and experimental data from University satellites *should* really take place on commercially 'paid for' frequencies and not be hosted under the guise of being 'amateur radio' satellites, when there are no communications transponders and the primary mission is simly not in the benefit of the amateur radio community.

IMHO Uosat1 started the rot with UoSAT2 following close behind. Having seen that there was not a great furore about experimental university satellites hijacking amateur frequencies, the floodgates opened and it seems that University satellites somehow have 'the right' to use amateur frequencies for non-amateur missions.

I don't have any problem with amateur radio spacecraft carrying useful amateur radio payloads such as transponders but surely the amateur bands should be reserved for use by radio amateurs and not university groups flying quasi-commercial payloads under the weak guise of being allocated an AMSAT Oscar number!

Would you expect a genuine amateur radio payload to operate on the commercial radio bands? Of course not... so why have commercial payloads using amateur frequencies for data download?

Sure, it could be argued that the RF spectrum is expensive but is that in itself justification for university projects to use amateur frequencies? I doubt it.

In the real world, its called freeloading and it's greatly frowned upon.

378. AO-7 Predictability.

Yahoo group: eu-amsat
Date: 2006-01-18 10:51:06 UTC
From: john hackett
Topic: 378 Message: 378

Between the 9th and 19th of January I've observed the mode change from A to B on AO-7 to be consistent and regular. This shows that the 24 hour timer is functioning as it was designed to do ... 31 years! ago.

I assume the reason for the present "predictable" mode changes to be the fact that the satellite is not, nor will be, in eclipse until at least March.

After checking the log on "THE AO-7 RESOURCE PAGE" I estimated the switchover to be at
approximately 08:30 UTC daily. However, on the 17th of January, I noticed the changeover happened at precisely 08:57 ... in the middle of a Mode-B QSO with UA9CP ... so I immediately switched to mode-A and carried on the QSO ... therby confirming the time of the mode change on that particular day.

Speculating ... this deviation could be due to the extra temperature seen by the satellite while not in eclipse. Those interesting in the orbital mechanics can plug the date and time into their favourite tracking program and "see" where the satellite was. The newly updated "AO-7 RESOURCE PAGE" now contains links to charts showing the current eclipse forcast.

The designers of this particular piece of hardware must be somewhat surprised that it's still functioning after 31 years in space, taking into account the radiation bashing it must have experienced in the last three decades.

Perhaps AO-7 is not yet finished with dishing out surprises.

The ESA and NASA take note!.

Topic: 378 Message: 379

John,
today morning the AO-7 switched from Mode-B to Mode-A at 08:59 UTC.
I was looking before 08:59 and I heard 2 tuning-signals around 145950, so
was obvious that the bird was QRV on Mode-B.
After 08:59 the signals stopped.

I switched my Rigs to Mode-A and I heard the F6BYJ (Jep) "loud & clear" on
29449,
he sent "CQ CQ CQ de F6BYJ" on CW!
I had a short QSO with Jep (09:05 UTC) by using my old .... GP-antenna
and .... 15 Watts Power on key!!!
Great QSO ! Signal reports was 559 from both sides (AO-7 was over
Gibraltar.)
AO-7 seems to be in excellent-excellent shape !
I enjoyed this QSO with my GP-antenna !

73, Mak SV1BSX

Hello Al,
I think you'll find the following mail of extreme interest.

The work we did re: the radar dosage was apparently not in vain.

We're planning a new pane on the log page for 2C ... (the 24 hour timer parameter) ... that will show the mode whenever the beacon is functional.

All satellite enthusiasts "should" read Jan's comments.

OBSERBVATIONS FROM NORWAY.

Jan: 2006.

AO-7 MODE-CHANGES.

For those that requested more informasjon on AO-7's mode changes and the 24 hour timer that controls this change.

On page 6 of the December 1974 Amsat newsletter the timer is described thus ...

The 24 hour timer is derived from a 3.181457Mhz crystal followed by 39 divide by 2 counters (you can do the math yourself.....LA2QAA).

However, after having been in contact With Jan King W3GEY ... (now VK3GEY) ... whom was the project manager for AO-7 and helped design and build the satellite ... (together with Karl Meinzer DJ4ZC, among others) ... in his garasje 30 odd years ago, I have been given the following informasjon.

(Those satellite enthusiasts who don't recognise those callsigns ought to be lined up against a wall and shot!).

The timer uses a simple CD4001AD RC oscillator comprising 1 x capacitor and 1 x resistor (!) ... not particularly accurate but then it was never meant to be. Space (pun intentional) was at a premium and the priority was on the actual RF transponders ... because even under testing on the ground there was a mode-B command RX desense problem ... (which was never fixed).

What must be remembered here is that this was before the days of the NE555 timers ... (not that they're particularly accurate either) ... buffered CMOS and case-hardened chips were not available in those days ... imagine the radiation dose AO-7 has experienced in the last 31 years.

The CD4001 RC oscillator was followed by 22 divider stages. Karl Meinzer felt that accuracy wasn't that importan ... which it wasn't ...the emphisis was on low power consumption. Naturally, such a circuit was prone to drift but even that wasn't important either ... and anyway, who would have expected it to perform in a space environment more than 30 years! later ... (ok, so it hibernated for 20 years).

The general idea of the clock ... which is parameter 2C in the beacon telemetry ... was ... no, *is* to increment until it reached 96 ...this can be seen by the telemetry 2C parameter changing every 15 minutes ...

(ok!, pencils out ...how many 15 minute periods are there in 24 hours?) ... then when it reached 96 it would trip the circuit that would change the mode from A to B ... (or vice-versa) ... reset, and start counting again.

Amazingly!, 34 years later, while AO-7 is out of eclips, the counter is still clocking up the milage.

Unfortunately, the beacon is not as healthy as it once was due to lack of power ... ("Gators" take note!) ...
so copying the telemetry is still quite a random affair, even though to all intents and purposes the transponders are functioning ... this, despite the extreme radiation dose that is most certainly *not* good for the solar array.

However, the sun angle is still good so there's no reason why AO-7 shouldn't prove many more years of communication possibilities ... providing! we all use a bit of common sense and follow the recommended operating proceedures outlined on the AO-7 RESOURCE PAGE.

This page, and "everything ou need to know" about operating AO-7 can be found at ...

<http://www.planetemily.com/ao7/redirected.php>

PS.

The current mode changes ... (between A, B and C) ... occur between 08:30 and 09:00 UTC daily. This *may* or *may* not change back to "random" after the spring of 2006. If you can't hear (or copy) the telemetry just check the AO-7 log page for the current mode.

385. Fw: P3E launch in 2006?

Yahoo group: eu-amsat
Date: 2006-01-31 01:04:48 UTC
From: SV1BSX
Topic: 385 Message: 385

----- Original Message -----
From: "Peter Guelzow" <peter.guelzow@...>

> > NASA Space Calender shows the P3E launch date is set at October 2006.
> > http://www2.jpl.nasa.gov/calendar/
> >

I have informed the owner of the NASA Space Calender, that the published "March 2006" launch date for P3-E is not correct.
Unfortunately this mis-leading information is still there.

In the meantime the solar generator for P3-E was finished and delivered to our Integration Laboratory in Marburg. 5 panels (each Pmax = 35W) were equipped with Si cells and 2 panels (each Pmax = 49W) with GaAs cells. One panel is therefore in reserve. For the P3-E solar panels we use for the first time a new material: Sandwich layers of aluminum honeycomb material and a surface layer from glass fiber/epoxy resin in 6mm strength. The reason for this is, that the special honey honeycomb material used in former times was only available when purchased in enormous quantities and to exorbitant prices. By installing inserts with an electrically conducting adhesive, the electrical conductivity is secured by the aluminum structure of the honeycomb material.
Additionally thick cover glasses were attached, in order to protect the solar cells against the rough conditions in space. For material and expenditure for the production of the panels we had to pay an amount in the order of six digits of Euros .

Further important activities concerned the assembly of the earth and sun sensors, qualifications of the separation spring, final work on the assembly of the solar panels, manufacturing the clamp band for the separation system, preparing for building the wiring harness and various technical meetings to finish the IHU-3 software and designing the new SDX.

I have to apologize that our Web pages are a little bit outdated. But as mentioned in my previous eMail, the transfer of contents to our new CMS system takes somewhat longer than hoped and more time is needed. On the other hand, we currently have to concentrate our efforts to finishing P3-E.

A special Commemorative SuitSat QSL Certificate will be available to those sending in reports of SuitSat signal on 145.990 MHz FM. Suitsat is due for launch Friday 3rd Feb at 22:20 UTC and will only transmit for a few days. For further details see

http://www.southgatearc.org/news/february2006/suitsat_qsl_certificate.htm

SpaceWeather.com is providing an alert service to let you know when SuitSat is within range, see

http://www.southgatearc.org/news/february2006/spaceweather_alerts.htm

A Slow Scan TV decoding programme to display the SSTV picture that will be transmitted by SuitSat can be downloaded from

http://mmhamsoft.ham-radio.ch/mmsstv/

Further information on SuitSat can be found at

http://www.southgatearc.org/news/index.htm

To find out when you can hear SuitSat use the AMSAT Online Satellite Pass Predictions page. Suitsat will be in the same orbit as the International Space Station so select ISS

http://www.amsat.org/amsat-new/tools/predict/

AMSAT-UK produce a quarterly newsletter "Oscar News" which is full of Amateur Satellite information. For membership details contact the secretary Jim Heck G3WGM

* Two More Days Until SuitSat!
* Commemorative SuitSat QSL Certificate Will Be Available
* Amateur Radio Performs Key Role in SuitSat's Main Mission
* Area Coordinator Makes Educational Outreach Materials Available On-line
* ISS Packet Turned Off for Duration of SuitSat
* ISS Cross-Band Repeater May Relay SuitSat Signals on 437.800 MHz
* How to Receive SuitSat's SSTV Image
* SuitSat Web Link Compendium

SB SAT @ AMSAT $ANS-032.01
Two More Days Until SuitSat!

AMSAT News Service Bulletin 032.01
From AMSAT HQ SILVER SPRING, MD.
February 1, 2006
To All RADIO AMATEURS
BID: $ANS-032.01

Frank Bauer, KA3HDO, who is the ARISS International Chairman and AMSAT's V.P. for Human Spaceflight Programs, reminds us if all goes well, SuitSat will be deployed in 2 days. Are you ready?

SuitSat will be deployed during a Russian EVA scheduled to take place on Friday, February 3 at approximately 22:20 UTC. NASA TV will provide live coverage starting at 21:30 UTC. For digital downlink information and access to NASA TV's Public Channel on the Web in RealPlayer, RealAudio, or Windows Media Player formats, visit http://www.nasa.gov/ntv.

Once the crew is outside on their EVA, they turn all three switches on the control box to the ON position and deploy the spacesuit from ISS. About eight minutes after the crew flips the three switches the Kenwood transmitter will power up. About eight minutes after that, the first voicetelemetry message will be transmitted and SuitSat operations begin! This 16 minute delay is a crew safety measure.

Next, Russian Cosmonaut Tokarev will carefully jettison SuitSat-1 by pushing the suit away at about a 30-degree angle upward and about 10 degrees to the left of the back of the station.

Once activated, those who hear SuitSat transmissions on 145.99 MHz are asked to enter their realtime data on the SuitSat website, http://www.suitsat.org/ so that participants around the world can track the satellite.

When first released SuitSat will be in pretty much the same orbit as the International Space Station. This means initially the ISS tracking parameters can also be used to track SuitSat. SuitSat will not have any thrust to maintain its orbit so it will begin to reenter the Earth's atmosphere after a few weeks. As SuitSat's orbit decays it will "fall" closer to Earth. As the days go by, SuitSat's lower orbit will begin to lead the ISS orbit so you will need to begin listening a few minutes earlier than when the ISS is predicted to come over your location.

You can track the location of the ISS on the AMSAT website at:
http://www.amsat.org/amsat-new/tools/predict/satloc.php?lang=en&satellite=IS
S

You can also get a listing of ISS passes at:
http://www.amsat.org/amsat-new/tools/predict/
Just enter your location and select the ISS.

Educational Outreach reports (at schools or informal education sites) as well as Slow Scan TV images can be sent to suitsat@.... This information will be compiled by the ARISS team.

[ANS thanks Frank, KA3HDO and the ARISS Team for the above information]

/EX

SB SAT @ AMSAT $ANS-032.02
Commemorative SuitSat QSL Certificate Will Be Available

AMSAT News Service Bulletin 032.02
From AMSAT HQ SILVER SPRING, MD.
February 1, 2006
To All RADIO AMATEURS
BID: $ANS-032.02

Students, scouts, teachers, ham radio operators, and the general public are encouraged to track the space suit, hear the conversations from space, copy the suit telemetry and capture the picture.

There will also be a special endorsement on the award certificate for those students who receive the "special words" that are embedded in the messages from our SuitSat student "crew members." These special words are in different languages - English, French, German, Spanish, Russian, and Japanese. You are encouraged to record the SuitSat downlink audio

and get help from fellow students who know these languages.

Radio Amateurs, students and teachers who hear SuitSat should send their signal reports with a large (9x12 inch) self-addressed stamped envelope to one of these addresses listed below:

* USA: ARRL Headquarters
SuitSat QSL
225 Main Street
Newington, CT 06111-1494 USA

* Canada: Radio Amateurs of Canada
SuitSat QSL
720 Belfast Road
Suite 217 Ottawa Ontario K1G 0Z5

* Europe: F1MOJ - Mr CANDEBAT Christophe
SuitSat Europe QSL Manager
7 Rue Roger Bernard
30470 AIMARGUES FRANCE

* Japan: SuitSat Japan QSL
JARL International Section
Tokyo 170-8073 JAPAN

* Russia: Alexander Davydov, RN3DK
Novo - Mytishchinsky prospekt 52 - 111
Mytishchi 18
Moskovskaya obl. 141018, RUSSIA

* Other Countries: Please use the US or Canadian address above.

Also included in this spacesuit is a computer Compact Disk (CD) with images of over 300 items collected from schools and educational organizations around the world. These include creative works of art from students as well as student signatures, school or scout logos, and class or group pictures. Students, schools and educational organizations that participated in the development of this disk earlier this year will all be part of the SuitSat spacewalk---as their creative works, signatures and pictures all float in space!

[ANS thanks the ARISS team for the above information]

/EX

SB SAT @ AMSAT $ANS-032.03
Amateur Radio Performs Key Role in SuitSat's Main Mission

AMSAT News Service Bulletin 032.03
From AMSAT HQ SILVER SPRING, MD.
February 1, 2006
To All RADIO AMATEURS
BID: $ANS-032.03

The idea for SuitSat was first conceived by the ARISS-Russia team, led by Sergey Samburov, RV3DR, and was extensively discussed at the joint AMSAT Symposium/ARISS International Partner meeting in October 2004. The project, is being led by project manager A. P. Alexandrov and Deputy Project Manager A. Poleshuk from RSC Energia, located in Korolev (Moscow area) Russia. The project was developed primarily by a joint US/Russian team. On the US side, the hardware project development was led by AMSAT member Lou McFadin, W5DID.

The official name for this mission is SuitSat-1, also called Radioskaf or Radio Sputnik in Russian. SuitSat-1 is the first live test of using the old spacesuits as inexpensive on-orbit platforms for instrumentation, space photography, telemetry, and communications.

Exposed to the full rays of the sun in space will SuitSat be able to operate in these extreme conditions? How will communications be affected if SuitSat begins to tumble? How long will the batteries last? Amateur Radio will be pioneering the answers to these questions in the days to come.

An additional benefit is the opportunity to bring space science into the classroom.

[ANS thanks ARISS-Russia and Energia for the above information]

SB SAT @ AMSAT $ANS-032.04
Area Coordinator Makes Educational Outreach Materials Available On-line

AMSAT News Service Bulletin 032.04
From AMSAT HQ SILVER SPRING, MD.
February 1, 2006
To All RADIO AMATEURS
BID: $ANS-032.04

Pat Kilroy, N8PK and David Bern, W2LNX provided a well received educational mission this past week to Parkland Middle School in the Washington, DC area. Included below is Pat's documentation which can be used with NASA and AMSAT materials for SuitSat educational opportunities in the coming days.

Also included are photos from the school visit.

SUITSAT: A Special (and Brief) Opportunity
Updated January 25, 2006

Original material is at: http://www.patkilroy.com/amsat-dc/

An old Russian space suit will be tossed off of the ISS during a spacewalk on February 3, 2006 (or after). The suit will be empty inside except for radio gear assembled for a special occasion.

Transmitting nearly continuously, kids around the world will enjoy its spoken messages over the life of the batteries, designed to last for a few days, perhaps a week.

The "SuitSat" will co-orbit with the space station for a while. Atmospheric drag will drift it into "its own" orbit, a decaying one, and will gradually warm up the suit and the stuff inside.

Listen for the 8-minute cycle of announcements when it flies overhead. You will hear "spoken" MET in minutes, the inside temperature in degrees C (not F) and battery voltage telemetry, pre-recorded greetings in multiple languages, a single "cell phone quality" SSTV picture frame in Robot-36 mode, as well as the voice ID on 145.990 MHz FM at 500 mW into its low-gain omni antenna.

SuitSat will re-enter the atmosphere in a few weeks, long after the batteries run dry. Time is of the essence and you ought to prepare now for this unique and fun experiment.

You may download a 6-page color document by Gould Smith, WA4SXM, and Steve Bible, N7HPR, (600 KB in PDF, dated November 5, 2005) at http://www.patkilroy.com/amsat-dc/SuitSat%20-%20A%20Unique%20Satellite.pdf

This has a full description of the event, additional technical details and several great photos. Go to the main AMSAT-NA web site for additional descriptions, late breaking news, and tracking data updated daily after SuitSat is deployed.

For lighter reading you may download a copy of a NASA press release written for kids:
http://www.patkilroy.com/amsat-dc/NASA_SuitSat_kids.pdf

Kids are welcome to take this copy to their school to ask permission to listen for SuitSat during class time. In addition to this press release, a sheet of technical details and the schedule for a televised (and webcast) press conference is offered for their teacher or mentor at: http://www.patkilroy.com/amsat-dc/ANS%20SuitSat%202006-0122pk.pdf

Enjoy these three documents. Each one has links noted where you can get updated information.

For those Amateur Radio operators in the greater Maryland and D.C. area, PLEASE REPORT YOUR OBSERVATIONS to us on the amsat-dc mail list. Of special interest to me are results of antenna A/B tests (omni vs. yagi reception) and your results of Doppler compensation (of how valuable it is or was or was not for the SuitSat experiment). Did you bother to make an audio recording of a pass? WAV or mp3? Any students involved? K-5, 6-8, 9-12, college, family, club or general public demo?

Get this into the schools! PASS THE WORD about this special event to other radio amateurs so they can prepare their station and share the news further.

Have fun!

Sincerely,

Pat Kilroy, N8PK
AMSAT Area Coordinator
Greater MDC Area

[ANS thanks Pat, N8PK for the above information]

SB SAT @ AMSAT $ANS-032.05
ISS Packet Turned Off for Duration of SuitSat

AMSAT News Service Bulletin 032.05
From AMSAT HQ SILVER SPRING, MD.
February 1, 2006
To All RADIO AMATEURS
BID: $ANS-032.05

For the duration of the SuitSat project, the ISS packet mode will be turned OFF. Please do not transmit any packet or voice data on 145.990 MHz which is also the SuitSat down link frequency.

[ANS thanks Miles, WF1F for the above information]

/EX

SB SAT @ AMSAT $ANS-032.06
ISS Cross-Band Repeater May Relay SuitSat Signals on 437.800 MHz

AMSAT News Service Bulletin 032.06
From AMSAT HQ SILVER SPRING, MD.
February 1, 2006
To All RADIO AMATEURS
BID: $ANS-032.06

There is a possibility that the ISS Kenwood D700 may be configured to act as a telemetry cross band repeater for the SuitSat project.

The Russian team is working on the details to program the D700 to retransmit the telemetry from the SuitSat via 437.800 MHz FM. The reason for the rebroadcast is to extend the listening range of the SuitSat project.

When SuitSat is launched, it will be flying very close to the ISS. As the days go by, the distance between the two satellites will gradually increase to hundreds of miles. SuitSat will eventually lead the ISS by several minutes.

The cross band telemetry mode can in theory double the listening range of the SuitSat project. The 2-6 day battery life of the SuitSat will be the actual limiting factor of this project.

[ANS thanks Miles, WF1F for the above information]

/EX

SB SAT @ AMSAT $ANS-032.07
How to Receive SuitSat's SSTV Image

AMSAT News Service Bulletin 032.07
From AMSAT HQ SILVER SPRING, MD.
February 1, 2006
To All RADIO AMATEURS
BID: $ANS-032.07

Slow Scan Television, or SSTV, is a method used by Amateur Radio stations to send JPG still images around the world. SSTV translates the picture information in an audio format suitable for transmission by radio.

The SuitSat project will transmit telemetry, pre-recorded voice messages and one SSTV image using the Robot 36 format. The message cycle will repeat approximately every 9 minutes.

To view the SSTV image you will need to connect your computer to the speaker of your radio. Your computer will require SSTV decoding software available from the sources below:

ChromaPix
http://www.barberdsp.com/

W95SSTV by Silicon Pixels
http://www.barberdsp.com/w95sstv/w95dload.htm

MMSSTV
http://mmhamsoft.ham-radio.ch/

Start with this web page to help you learn more about Slow Scan TV:
http://www.marexmg.org/fileshtml/sstvlinkpage.html

For tips on how to use SSTV, Packet and Voice via the ISS see:
http://www.marexmg.org/fileshtml/howtouseiss.html

Excellent information with links to SSTV software downloads can be found on W2MU's SSTV Page: http://www.qsl.net/wm2u/sstv.html

[ANS thanks Miles, WF1F for the above information]

I just realized that the Space Calender changed the launch for P3-E from
March 2006 to October 2006. ;-)

Still, there is no such official launch date yet..

From: Trevor AKA
Topic: 390 Message: 390

It was feared that SuitSat was lost see

http://www.southgatearc.org/news/february2006/suitsat_dead.htm

However Achim DH2VA/HB9DUN reports it being heard this morning at 0917 UTC

73 Trevor M5AKA

Suitsat-1 heard 0917UT !

Hello all!

positive report from DL0WH (Clubstation Weinheim)

0917 UT : clear over noise, girls voice: 'This is suitsat-1'

We have it on video tape and just play it back and forth, but even audible
if retransmitted over 2m local :)

In addition strong QRM once every 5 sec from local station trying to
uplink on 145.990.. stupid !

For the second half of the pass also QRM by local cable network leaking
here in the 2m band..

We will try to convert the movie and put it online, but give us some
days..

391. Calling all AO7 aficionados

Yahoo group: eu-amsat
Date: 2006-02-05 20:30:35 UTC
From: Allan Copland
Topic: 391 Message: 391

Hi Folks.

Phil Karn KA9Q, better known for his contributions to the Internet in the form of KA9Q NOS, maintains a superb library of photographs taken during the construction and launch of AO7. I believe most of the images were taken by Dick Daniels.

The site is excellent and there you can see some of the famous faces of the satellite scene in the 70's. Two I recognised immediately were the ever helpful Jan King W3GEY and Karl Meinzer DJ4ZC.

The archive can be found at..

www.ka9q.net/ao7/

I have also copied this address to the links page.

I strongly recommend a visit for all AO7 fans.

There among other excellent photographs, you can see the battery that has caused so much trouble over the years.

Strangely I cant find a link to it from Phil's main index page... but maybe thats just me, I think I'm going OBS...

Oh, you don't know what OBS means? Well ask LA2QAA.

Kind Regards,
Al.

392. Amateur Radio satellite Coordination pages IARU.... and a question for readers.

Yahoo group: eu-amsat
Date: 2006-02-07 10:06:23 UTC
From: Allan Copland
Topic: 392 Message: 392

Hi,

There's quite a bit of information re forthcoming birds on the IARU pages.

You can find them at .. http://www.iaru.org/satellite/

Taking a look through them shows a fair number of birds that are downlink only. I imagine this is in large part in order to collect data from University experiments. The British built UoSATs 1&2 were to my understanding the first university birds to start this trend. They were flying test beds for a variety of technology, much of which has been transferred to the commercial sector. SSTL now do much more commercial work now with a change to commercial frequencies having taken place.

Many other Universities have seen and used the opportunity to fly what are essentially scientific and experimental payloads on Downlink only birds using the amateur radio bands. This is not a new phenomenon. In fact John Branegan GM4IHJ mentioned it a considerable time ago in one of his weekly SATGEN bulletins.

I have a question for all European AMSAT-EU group users.

'Do you think downlink only University project satellites have a place in amateur radio satellite service?'

To obtain an Oscar number, a satellite (any satellite) only needs to have a downlink in the amateur radio bands. They don't need to have an uplink or any form of communications transponder(s) on board. They dont need to have been built by radio amateurs either.. they only need a designated 'keeper' who holds an amateur licence and be cleared by IARU to use the amateur bands.

Am I the only person who thinks that University project 'downlink only' satellites should use commercial frequencies and leave the amateur bands free for transponding satellites?

You can contact me off reflector at gm1sxx@... with your views. Do bear in mind that this is a European reflector so I'm only interested in replies from Europe.

Kind Regards,

Allan Copland

From: Jean-Jacques DE REY
Topic: 392 Message: 394

Hello Allan,

I completely agree with your view on the subject.

If payload has neither :

a.. a transponder enabling 2 way HAM-communications
b.. a transmitter providing usefull data to the HAM community
c.. components effectively designed or assembled by HAMs
d.. the possibility for HAMS to build-up experience
Then it has no place in our bands !

Well, I think that was a foregone conclusion, but what do the rest of you think? I'd very much like to hear your views on this subject.

Is there a place for University birds on the amateur bands or should they as I suggest have their own seperate frequency allocation?

For anyone who wants to know more about how Oscar Numbers are allocated, I'd suggest you read the official AMSAT document.

http://www.amsat.org/amsat/amsat-na/oscar.html
You may get a surprise.

Three things are worthy of note.
1) Any bird with a transmitter in the amateur bands that meets several criteria is eligible.
2) Such birds dont have to be of AMSAT origin ... and some indeed have not been.
3) Designated Oscar satellites don't need to carry uplinks in the amateur radio bands.

Item 3 is an open invitation to use amateur radio frequencies for University birds with little or no relevant amateur radio content. They don't need to carry transponders or in fact anything of particular use to the amateur radio satellite community. They only need have a transmitter on board in the amateur radio satellite bands to meet the requirement.

Surely this is some sort of error or omission, or have I missed something here?

What do the rest of the group in AMSAT-Europe think?

Regards,

Allan Copland

It's an interesting question, there are about 40 satellites either being built or completed awaiting launch which will use the Amateur Allocations. Almost all of them only provide one-way telemetry transmissions.

The important thing is that the format of the telemetry is made publically available so that Amateurs can make use of it. My understanding is that this is a requirement for a satellite to be given a designated frequency by the IARU co-ordinator and an Oscar number after launch.

University satellites programmes are a very good thing for Amateur Radio. Designing and building satellites fires the imagination of young people and so far many hundreds of young people have been actively involved in designing and constructioning satellites. Granted they are not Hams but that's only because until they got involved in building sats they'd have been totally unaware that a hobby called Amateur Radio even existed. Typically Amateurs don't try to actively promote the hobby to young people. Go to any classroom and ask the students if they've heard of "Amateur Radio" the answer will be a complete blank, no-one under 25 knows about us!!

I am glad to say that some of the students involved with satellite construction have since gone on to because Amateurs.

Put bluntly there is a shortage of Amateurs who are actually prepared to participate in building a satellite themselves. Too many Amateurs expect somebody else to build the satellites for them. We should be thankfull that so many students are being exposed to the hobby by the University satellite programmes because some of them will be ones you'll be building 2-way Amateur communications satellites for us in the years to come.

The rationale behind the Amateur Radio Services is self training and education, University Satellites completely satisfy this objective and they are a good use of frequencies that otherwise would be completely unused.

From: John Alan Hackett.
Topic: 397 Message: 397

Hi all,
For what it's worth here's my opinion.

University experiments that have no interest or value
to RADIO AMATEURS should *not* be allowed to be conducted
within the AMATEUR satellite allocation of frequencies.

They should be subject to the same provisions as any other
COMMERCIAL operator.

I concur with Al and JJ on this one.

What next? ... license free CB on 20m?.

Hi Folks,

It would help me greatly if youd post your answers with a simple YES or NO in front of any text you wish to add. That way, I can keep track of views but not have to make any value judgements as to what those making postings think. Zero Bias if you like.

Additional text with your personal thoughts is very welcome and I'll try to make an archive that will be made available to all as a single file. This has the potential to be of interest to European satellite users. OK, this is only a small group, but your input is what keeps it alive.

Hi,

This one is for Trevor M5AKA.

He said....
> Put bluntly there is a shortage of Amateurs who are actually prepared to participate in building a satellite themselves. Too many Amateurs expect somebody else to build the satellites for them.<

Well, I have to strongly disagree with this comment.
I for one would be delighted to participate in any way I could on a UK led program for a linear Leo Bird. Perhaps a replacement for the ailing but very popular AO7? I'd even be willing to throw some money at such a project.

Building the hardware is only a part of the process. What about the really difficult stuff such as planning, project management, testing, licencing, fundraising, marketing, and the multitude of other less glamorous tasks involved in such a project. I dont see those mentioned.

The UK now has a track record outside of University built birds such as those from the UoS. AMSAT-UK members have already constructed flight hardware for the ill-fated SSETI Express mission. They already have the know-how to construct space rated hardware. The European Space Agency flew their hardware. Does that sound like apathy to anyone?

AMSAT member David Bowman G0MRF already has a working prototype experimental Mode U/V transponder up and running. You can see more on his website. More apathy?

Sorry Trevor, but I don't think there is a shortage of willing hands here in the UK. If there is a problem here in the UK, that's not it.

There may be a shortage of money and there may be a shortage of direction but there *is* expertise available.

Kind Regards,
Al, GM1SXX

Absolutely, there's a considerable amount of work involved and such a project needs people with the right skills who are willing to dedicate large amounts of time over a long timescale.

> AMSAT member David Bowman G0MRF already has a working prototype
> experimental Mode U/V transponder up and running. You can see more on
> his website.

Were you at the Annual International AMSAT-UK Colloquium at Guildford last July ? The Stella Mode B transponder that Howard and David developed was one of the many highlights of the event, see http://www.g6lvb.com/Articles/STELLA/
The beauty of the DSP technology is that you'll never have any more problems with Alligator stations. It also solves the dynamic range problems that prevent terrestrial cross-band linear transponders but that's a seperate issue.

> Sorry Trevor, but I don't think there is a shortage of willing hands
> here in the UK. If there is a problem here in the UK, that's not it.

Name me a willing hand prepared to lead the project ? Everybody takes one step back when that subject is raised. Without someone to drive the project forward nothing will get done. Raising the money is not such a big problem. I'd have thought using volunteer labour and a few borrowed parts you could do a LEO Mode A or Mode B satellite for less than 250K.

I was very impressed by the Dutch Delfi-C3 student delegation who attended last July's AMSAT-UK Colloquium. About 16 of them were there all very keen and enthusiastic. For their Mode B satellite, due for launch later this year, they are using a very cheap form of construction for the satellite frame - Three off-the-shelf cubesats modules joined together, certainly a good way to reduce costs. For details of Delfi-C3 see
http://www.stec2005.space.aau.dk/getpdf.php?id=120

I don't know what their for the project costs are but I suspect the coupled cubesat frame approach it could be possible to substantially reduce costs.

403. Re: Amateur Radio satellite Coordination pages IARU.... and a question for reade

Yahoo group: eu-amsat
Date: 2006-02-07 20:54:32 UTC
From: Allan Copland
Topic: 392 Message: 403

Hi Trevor.

I started this new thread to answer some of your points raised.
You raised some interesting points in your last reply to me.

I'll try to provide a personal reply to you most relevant criticism
of radio amateurs in the UK with regard to satellite projects.
==========

1) Firstly Cubesats. They have an inadequate power budget to support
a linear transponder, ergo I have absolutely no interest in helping
fund or support such projects.

2) Ditto FM birds. IMHO FM is a completely inappropriate
modulation scheme for satellite comms at the best of times and
teaches users that all the things you should never do on a linear
bird are actually OK to do. They set a the worst example possible
for those wishing to migrate to linear birds.

AMSAT-UK's decision to support just such a bird was why I left... and
joined AMSAT-India instead, to help support the HM-1/Hamsat project.
I'm told I was NOT alone in making this decision. I used to be AMSAT-
UK #3286.

3) I'm have no interest in 'me-too' university birds that don't
carry linear transponders as their primary mission and would not help
fund or support those either.
IMHO we have enough useless me-too projects already in the pipeline.
There are plenty currently listed on the IARU website.

4)I WOULD personally help support and/or fund a project for a low-
tech single-transponder LEO linear bird on the lower frequency
bands. As you probably already know linear birds can support
multiple QSO's while being educational for all concerned. Somewhat
interestingly some people dont seem to realise this proven fact or
appreciate its significance.

5) By lower bands I really mean Mode B but I'd be happy to devote
time, effort and some cash to other options at a pinch so long as it
was for a low-tech single linear transponder LEO bird with a decent
power budget.

6) I WOULD be willing to do mechanical or electronic construction
work thats within my capabilities, especially mechanical.

7) I WOULD also be happy to act as chief scrounger for materials for such a project. I'm pretty good at scrounging.

8) I WOULD also be happy to rope in other competent people to help out, particularly on mechanical components for such a bird. I believe that I could motivate other people in my personal circle of non radio amateur friends to do work on such a bird. I have already asked some of them. The response was favourable.
By this I mean machining and fabrication of structural components and mechanical items

9) I WOULD also be happy to do anything else asked of me that was reasonable. This also includes putting in long hours.

10) I don't class myself as project manager material but with the support of other I DO believe that such a person could be found. (keep reading folks)

11) Without the support of UK radio amateurs, there is no hope of ever finding such a manager, ergo the possible perceived lack of enthusiasm. Chicken and egg.

11) I believe that such a project could be possible to realise with special emphasis on simplicity of design. In short, there's not a lot for 'designers' here but a possibility for longevity of mission through simplicity. Is this not what many users actually want?

12) Yes... I have an agenda. You've just read it. From what I hear asking around, quite a few people are keen on such a project.
The question is, how keen?

Re item 10... If I had to do this job, I probably would, but I'm considerably better at doing other things. I'd seriously consider it if the project had a realistic backing in the UK and Europe.
If I did that job though, I would not be doing a job I can probably do better.

The bottom line is that the supporters of the project are greatly more important than its manager. Bear that in mind.

The US are out of the linear LEO game, so I've been informed.. Phase 2 is over, so no support there.

One other thing to consider is support outside of AMSAT. I believe it exists.

Would any of the other members like to manage such a project?
I'm sure their first response would be.. 'How popular is this idea anyway?' That is a justified response.

How popular IS this idea?

Would I support DSP on such a project. Absolutely , so long as it was up to taking a 200,000 RAD lifetime radiation dose and could be

switched out of circuit on ground command if it failed.

Would I like an OBC on board? Not really, for the same reasons as with DSP. There's not really a lot of need for one on a linear analogue LEO and they have a habit of failing, or at least the RAM does.

CMOS logic is good though. It can take a real beating from radiation and still work. A VERY basic CMOS Single Chip Microcontroller might be OK but they don't have much of a track record. They'd need a good cooking from a gamma source to convince me.

I could ramble on, but I won't.

So, am I apathetic?
Decide for yourself.

Kind Regards,

Al.

Well the students on the Delfi-C3 project will show you how to do it - a satellite carrying a Mode B Linear transponder using three cubesats frames. They've certainly been very innovative given the limited space available.

I am very glad to hear you're prepared to start up a LEO project. As I said earlier I believe the problem is a shortage of volunteers willing do do the work. I will be delighted if I am proved wrong.

Hi Trevor M5AKA,

I really wonder how concerned, involved and interested with our hobby/community the students who carry out " ... the experimental work in the bands allocated to the Amateur Satellite Service ... " really are.

I am very much afraid that they dont care very much on which frequency their telemetry is sent to earth... even transmitted by a copper wire it would be fine for them!

Therefore I really dont believe that through the (mis?)use of our frequency bands / spectrum ('... never used ' or not, that is not a valid argument) we are gaining very much added value to our community.

But let us remain open minded and in a positive attitude. Everybody is welcome to join the club, as long as he shows interest for it and wants to get involved ...

If you are really looking for some educational / promotional value (one possible aspect), then make it as wide as possible, by taking for example 'space' to the classroom with some SUITSAT-like project.... or make your transmissions open / documented to public.

Off course the building of a satellite is a very educational value project purely within University, no doubt about it, but the fact that 'private telemetry' is transmitted on a HAM frequencies instead of outside 'our band' is totally not relevant for the project goals and objectives. In fact, not using our band and commercially available equipment could even be an additional educational challenge for the builders : let them design and build antennas, transmitters, receivers, ...

Best 73s

Jean-Jacques ON7EQ

PS1 : Talking about CB ... why don't they use 27 Mhz CB band ? this is completely open to public !

PS2 : If you are in doubt .... PS1 was a joke !

Topic: 406 Message: 406

Hi,

reading your very interesting opinions, firstly I have to say that I'm
against to any use of Ham-Satellite bands by non radio amateur
organisations, including universities . That's clear enough.

BUT, on the other hand, Trevor M5AKA has absolutely right. As he said the
Amateur Satellite Service is allocated on several MHz of spectrum that they
never use in practice by Amateurs. Its obvious that, the Amateur Radio
community
can not build enough number of Satellites, in order to occupated these
frequancies
high enough. So, some other organisations they find "free space"
of exploitation in our frequencies.

A mere example of this situation is reported on my country. The last
1-2 years the 2,4GHZ Band is used by a Wifi network, which is illegal.
I'm in fight with these peoples, I'm trying to explain that the 2.4GHZ is
not free but belongs to Amateur Satellite Service.
The short answer was: "is used? by who? we monitored this band and
never used the last 3 years by nobody" !
Believe that is it a "Greek pattent" ? NO ! As I learned several other
countries have similar problems by WiFi Networks. The problem begins from
WiFi-cards factories that manufacture these cards into... our 2.4GHz
Satellite Band !

So Gentlemans, I prefer to have few Satellites from known universities or
similar
organisations into the Amateur Satellite band which is UNDER AMSAT's control
,
than an non usable Satellite Band which soon or later will be lost. Yes, I
know, it is
not the best but in order to avoid the worst situation, rather it will be
better to
accept the reality.

Finally, few words about SUITSAT. Yes, I was also one people that I said:
"what a fun & stupid experiment".
But now its obvious that, it is one of the most popular Amateur radio events
during the
last years. Good or not, grand or funny, was reported from the biggest
Media-News
organisations, TV Satellite channels like CNN, NBC etc. (including
Al-Jazeera !!!)

The SuitSat URL had 2 millions hits in the first two days!!! Incredible
!!!

Well, definitely that is not too ...funny story. The profit for the Amateur
Radio is very big.
Very-very positive.
And definitely our hobby needs this kind of publicity in
order to attract "newcomers". Since our hobby passes crisis from the
Internet's goodies, high technology etc., it is better we are realists.
Better you are realist, despite a dreamer, I think.

Hi Mak,

You said..
> Trevor M5AKA has absolutely right. As he said the
> Amateur Satellite Service is allocated on several MHz of spectrum
that they
> never use in practice by Amateurs.

I agree with you both there, but take a look at the frequencies that the 'me-too' university projects will use before suggesting that they will be helping fill the higher frequency bands. There I disagree with both of you.

The simple fact is that the higher frequency bands are not so heavily occupied. More University birds wont alter that, especially if they are Cubesats as a great many are. Think Power Budget.

> A mere example of this situation is reported on my country. The last
> 1-2 years the 2,4GHZ Band is used by a Wifi network, which is illegal.
> I'm in fight with these peoples, I'm trying to explain that the
2.4GHZ is
> not free but belongs to Amateur Satellite Service.

Yet again, I have to disagree with you there. The 2.4Ghz band is in my understanding an ISM (Industrial, Scientific & Medical) band. Unregulated in so much as anyone can use it. Lots of microwave ovens use it (they leak RF), as does industrial machinery (it leaks RF also). Where I live, 2.4Ghz is crammed full of signals of all sorts. My Wirelss LAN also uses 2.4Ghz as do many hundreds of thousands of others in the UK. Giving radio amateurs access to 2.4Ghz was not a great concession to the authorities. It was essentially already allocated to all sorts of machinery!

2.4Ghz certainly does *not* 'belong' to the amateur satellite Service. The amateur satellite service is listed as a Secondary User in IARU Region 1. We have to accept interference from the primary users. That would be microwave ovens, WLANS and welding equipment among other things.

Re suitsat. Can you talk through it? Does it do anything useful for you except to test the limits of your equipment? Will it provide a 'service' for the amateur satellite community in even six months time? I personally dont see the point of it except as a bit of (fortunately) short lived amusement. This is only my personal view to which I'm entitled and don't have to share with others. Your view is obviously different. Thats fine by me. I have no problem with people disagreeing with me. In fact, thats a good thing and hopefully can

stimulate further debate.

Kind Regards,
Al.

The students had never even heard of Amateur Radio until they get involved in the Satellite projects but that's probably true of anyone who's under 25, they just don't know that Amateur Radio exists.

> Off course the building of a satellite is a very educational value project
> purely within University, no doubt about it, but the fact that 'private
> telemetry' is transmitted on a HAM frequencies instead of outside 'our band'
> is totally not relevant for the project goals and objectives.

The details of the telemetry is available to everyone and Amateurs can make full use of it for their own experiments/research and some do. Amateurs need to build their own satellites to make use of their spectrum so that others can't use it instead. There are lots of other companies/organisations who would like to use the empty Amateur frequencies, the educational use of these frequencies is the least of our problems.

Governments of all countries regard having their students develop the high tech skills needed to design/build/management satellites as being very definitely in the national interest.

I think the Amateur Community needs to develop better links with Universities and work with them so that more satellites are produced that meet both our needs. The University projects typically only need the telemetry downlinks for a few months. The ideal situation would be if the university sats could then be switched over to two-way Amateur communications use preferably using a Linear Transponder.

Agreed, they have been innovative, but the CUBSAT structure, even with
deployable panels is too small to support both decently rated arrays
or suitably rated batteries for anything other than low power operation.

I have made this point already.

So, no, I disagree. The students on the DELFI-C3 will not show any of
us how to do a linear ModeB LEO with a long service life and simple
structures and systems although they may be enthusiastic and have some
excellent ideas.
Chalk may look a bit like cheese... but!

> work. I will be delighted if I am proved wrong.
>
> 73 Trevor M5AKA

Do the above comments from Trevor sound like support for a European
Satellite project? I leave it to you to decide.

Is this called enthusiasm and support?

Could I refer you all back to point 11 in my recent email.

11) Without the support of European radio amateurs, there is no hope
of ever finding such a manager, ergo the possible perceived lack of
enthusiasm. Chicken and egg.

I only have one more question.
****
Does such a project as I outlined have the support of UK amateurs?
****

It's a simple enough question.
Such a project would as you have rightly pointed out need considerable support and funding from European satellite enthusiasts.

Perhaps now is a time to find out.
Nobody yet, including M5AKA has replied with a positive reponse.

Just to reiterate, my suggestion is this.
****
A MODE B LINEAR LEO bird with the minimum of onboard systems optimised for reliability and long life.
****

Kind Regards,
Allan Copland

Trevor,
I was asked for an opinion ... (of which, like you, I'm entitled)
... so I gave one.

To answer your questions,

>Can you tell me why you think the Amateur Satellite Service should be
>allocated many MHz of spectrum that they never use ?

I've never implied that I do think that.

>Come on John what has CB to do with this !!

Merely an illustration ... that not following the rules determined by the
IRAU could lead to misinterpretation ... which it obviously has.

As mentioned, I was asked for an opinion and gave it ... end of story.

73 John. <la2qaa@...>

411. Support.

Hi Al,
After reading the entire thread regarding a phase 2 type satellite
I'd like to make the following comments.

I would support ... both financially and in any other way within my
capabilities ... a low tech: phase 2 type (mode-B) satellite carrying a
LINEAR transponder.

Let's face it, PSK at microwave frequencies on a LEO satellite... (AO-51)
... while theoretically possible was/is a complete fiasco ... even Peter
Martinez ... (the "father" of PSK) ... failed in his attempts to work the
satellite in this mode ... narrow bandwidth, microwave frequencies ... (U/S)
... with doppler like a bat out of hell ... who, apart from the elite few
could possibly afford the equipment needed to operate such a mode?.

My point? ... why finance satellites with modes that become redundant the
day they're launched.

I'd like to quote Commander John Brannegan (SK) ... a single RS- type
satellite provided more communications for more radio amateurs than all the
other later satellites combined!, built since.

That's still true today ... and we've had AO-40, VO-52 and AO-51 since John
wrote that.

Surely there's a lesson in there somewhere.

I've often been accused of addressing several unrelated subjects in the same
mail ... but I believe they are! relatated. It has been said that there is
no support for an "old" phase two type transponder.

I believe there is.

The smart ones in the group will realise that the thread mentioned earlier
was designed for the very purpose of guaging and collating that interest.

Most will remember Richard Limbear's "survey" many years ago. Despite the
overwhelming support for low tech: sats, Amsat-NA decided to go in the
opposite direction ... being privvy to the b.o.d. thinking at the time I was
told ... "but we have to keep the designers happy" ... but what use are the
designers without somebody to actually operate the satellites?.

Another piece of space junk?.

Incidentally, I believe the dissatisfaction of having their donations
finance something they didn't want was the cause of so many members of
Amsat-UK voteding with their feet ... (walking away).
At least that was the reason in my case.

413. Support for a Phase 2 LEO

Yahoo group: eu-amsat
Date: 2006-02-08 13:16:14 UTC
From: Allan Copland
Topic: 413 Message: 413

Hi Folks,

I was being pragmatic in my suggestion for a MODE-B simple LEO.
My own personal wish would be for something even less exotic but I am
smart enough to realise that Mode-B would be more attractive to a
greater number of potential users.

There is also the question of radio amateurs in the developing world
whose needs are simply ignored by those in the affluent West.

I've had suggestions in the past, not on this BBS. from people who
should know better, that people in those countries should just run out
and buy an IC-910H or whatever to better cope with doppler or whatever.
These folks obviously dont watch much TV or realise how much poverty
there is on our planet. Only people in rich countries like ours can
afford such toys.

I believe that Mode B is the best possible compromise for everyone.
Its a bit 'cheap and nasty' for some people in the rich West but a bit
'exotic' for others in developing countries. This is why I suggested
it. It would not be my personal first choice.

Lest anyone here thinks I'm knocking University birds, I can tell you
that I was a keen fan of UoSAT2 for many years. I even wrote the
telemetry decode software that our local University used in
conjunction with their 'ASTRID' dedicated receiver to collect data
from UoSAT2. At the time, in 1984, I wondered why the IARU ever
approved this bird. I still wonder.

I don't consider it to be an amateur radio satellite... it's an
intruder on our bands, freeloading in space.

Decoding telemetry and other beeps and burps is fine and dandy and of
interest to some, but amateur radio in large part is about
communications. After all, that *is* the purpose of radio.

It should be remembered that two-way communications are usually a lot
more fun than one-way communications:-) The same is true in the real
world.

I still take the view that these birds University birds should be
using commercial frequencies and NOT the amateur radio bands. UoSAT2
flew nothing of any utility for communications in the amateur radio
satellite service.

Sure, the flying mailbox concept on UoSAT eventually was transferred
to other birds but it was never made available to Mr Joe Public for

communication. I'm sure it could have been evaluated on the ground rather than in space.

It was always going to be very difficult but I wouldn't criticise anyone for trying or call their efforts a fiasco. But hey the transponder isn't limited to PSK-31, any data mode can go through and I reckon that the use of DominoEX, which is very tolerant of mistuning, would be feasable.

> I'd like to quote Commander John Brannegan (SK) ... a single RS- type

This of course opens up the discussion of do we want Mode A or Mode B? My preference is Mode A. Perhaps an even more important question is what orbit should it be in ?

I believe that LEO orbits between 600 and 1000 km are for practical purpose no good for two-way radio communication - the pass times and the range are too short. Orbits around 1400 km (as in Oscars 6/7) or higher (even MEO 4500 km ?) are what are needed. Clearly there are radiation issues about 1500 km but the use of very simple robust control mechanisms as used on Oscar 6 and 7 may be the answer here.

It would be better how?

Had you any specific orbit type in mind for a HEO? Polar, equatorial,
what? That makes a BIG difference to the satellite's coverage.

There is already a ModeB (plus other modes) Molniya under
construction. Won't that serve your needs?

The downside of HEO's is power. They need to be large birds with
large batteries and arrays and high power PA's. This costs big bucks.
Where would the funding come from? Perhaps you have just won the
lottery and have money to burn :-)

My proposal is for a LEO ModeB polar bird. The reasoning is simple.
The entire world is covered several times a day giving *all* potential
users reasonable windows of opportunity.

Lastly, don't forget John. He's pretty far North and some birds are
out of his reach! At least a polar LEO would give him a fair crack of
the whip (along with ALL of the other people on planet Earth).

Hi Allen, tnx for your reply.If i was lucky enough to win the lottery i would gladly give a big contribution to a sat building fund wether a HEO or LEO. I do know that building a HEO would take a lot of money.I have been a short wave listener for most of my life (started at 7 years old) I'm now 60 years old and spend most of my hobby with my radio. Mostly on rx. I talk to John LA2QAA most day's on AO7.Longer if he would get the moutains moved hi.I would suport any sat the majority wanted leo-heo. I and every body i talk to enjoy the sats, we meet and make friends all around the world.It is a great hobby , we all can give our thoughts in what we would like, but we must all stick together in our great hobby.
I don't often post messages on any web site
but i'm sure you will agree we must all pull together.
tnx for rx my 2 penny worth Terry G1WPR.

For once I agree with Trevor 100%

My preference would also be Mode A but I believe it would be less popular than Mode B so support would be an issue. This is why I suggested MODE B.

Remember though that Mode A space communications with a 1600Kms Polar LEO would be much affected by solar activity.
In my book that only adds to the fun:-)

It also would make such a bird accessible to a very wide user base, and especially in less affluent countries.

Oscar7 has demonstrated that batteries aside, satellites CAN survive for long periods at 1600Kms or thereabouts.
I talked with Jan Jing and he reckoned that AO7 has had a lifetime radiation dose of around 200,000RADS. Thats an unimaginably ferocious radiation dose over the 31 years its spend in space.

Its simple CMOS circuitry in large part is still working OK. The telemetry system works as does the mode switching timer.
When LA2QAA and myself copied good data from AO7 in Dec 1993, the telemetry was fairly nomonal, something that greatly surprised us.

More recently LA2QAA's detective skills led to an 'admission' by Jan that he and Karl used a cheap R/C CMOS oscillator circuit instead of a crystal as the timing element in the mode switching circuitry!

I also completely agree that simple robust control systems are highly desirable.

A 1600Kms orbit would be desirable from the point of view of footprint despite the radiation issue.

AO7 is far more complex than would be required for a single transponder bird. Much of the CMOS control circuitry used on AO7 could be replaced by more complex CMOS chips.

AO7 was built entirely out of early unbuffered CMOS chips and discrete analogue components. Any interested parties should check out the excellent photo archive listed on the links pages. The transponders were in large part built 'dead bug/turret tag' style. You can see this in the images.

[Not an Official AMSAT statement]

There is no "real" reason for building a satellite that is HEO/LEO - one can still put a satellite into an orbit between the inner and outer Van Allen belts providing that you are willing to deal with a low inclination (60 degrees or less) and occasional periods of higher radiation. Personally I think it is a better challenge offering many benefits - it would have long (~90 minute) footprints and would not have the power requirements that a HEO satellite would require. It wouldn't have to de-orbit since it would be in an orbit that no one wants.

One problem I feel is plaguing the amateur satellite movement is that the shift is from making scientific contributions towards simple "through it out the hatch" milestones. I think this is a really bad direction to go. Collection of scientific data in this higher would be beneficial.

As for Mode A, B or ?? I would still recommend ??. QRM is so bad in the 2M band that it is impossible (IMHO) to use this band for either an uplink or downlink. 70cm is also becoming an uplink problem. I would hold out for a 23cm uplink with simultaneous and 70cm and 13cm downlinks. It makes more sense (IMHO) however if size/power were an issue I would probably go with a 23cm downlink since there are groundstation advantages to use 23cm over 70cm (mainly antenna size).

Just my opinion - other's may vary.

Emily

Topic: 392 Message: 420

Hi Emily.

You said.

>There is no "real" reason for building a satellite that is HEO/LEO - one can still put a satellite into an orbit between the inner and outer Van Allen belts providing that you are willing to deal with a low inclination (60 degrees or less) and occasional periods of higher radiation. Personally I think it is a better challenge offering many benefits - it would have long (~90 minute) footprints and would not have the power requirements that a HEO satellite would require. It wouldn't have to de-orbit since it would be in an orbit that no one wants.

To answer a few of your points.

There is a compelling reason for going to HEO or LEO. Rockets go there.

Unless you want the added complexity of providing a propulsion system with its attendant cost, scope
to go wrong or be compromised by bad planning or judgements, you are stuck with what you can get.

Simple missions are stuck with what they can get... no bad thing in some cases.

Re challenges. Which is more challenging... a ten minute window or a longer one.
A HEO has challenges, but not really with regard to operating....many of the challenges are down to power
and real-estate. A LEO offers a large 'fun' element while providing a challenge. It is also truly Global.

With HEO's you need gain, or power, or a bit of both. 'Aluminium is cheap'... but bulky.

With a LEO, you don't need a lot of either.

Re deorbiting. I know that major space agencies like to have eco-friendly rockets but no amateur satellite to date has incorporated an de-orbit facility. All amateur satellite deorbits to date have been driven by orbital altitude and solar activity. I do accept that certain orbit slots are becoming somewhat 'cluttered' notably LEO and Geostationary to a lesser degree.

How many misssions go to a 60 degree orbit? I don't know of any.

>One problem I feel is plaguing the amateur satellite movement is that the shift is from making scientific contributions towards simple "through it out the hatch" milestones. I think this is a really bad direction to go. Collection of scientific data in this higher would be beneficial.

Well, I've never been a fan of 'Milestones'. Communications is what floats my boat. Perhaps I should qualify that by saying two-way communications. One way comms are pretty naff!

>As for Mode A, B or ?? I would still recommend ??. QRM is so bad in the 2M band that it is impossible (IMHO) to use this band for either an uplink or downlink. 70cm is also becoming an uplink problem. I would hold out for a 23cm uplink with simultaneous and 70cm and 13cm downlinks. It makes more sense (IMHO) however if size/power were an issue I would probably go with a 23cm downlink since there are groundstation advantages to use 23cm over 70cm (mainly antenna size).

I too used to believe that QRM on 2M was really bad. I tolerated lots of QRM for years. Quite recently, I invested in a three chamber helical filter from DCI.
NO QRM!
Most amateur radio gear is poorly/cheaply designed and intermod is a perennial problem. With my DCI filter in place there is no QRM on 2M across the whole band in CW/SSB in the centre of a large town with 80K inhabitants next door to a city of 250K people I'm not convinced by that argument.

Note also that there are quite a number of multi-megawatt RADARS oprating in the Northern hemisphere in the 70Cms band. These Military RADARS are the primary users in the band. The RADARS caused serious command problems for AMSAT satellite controllers in the past and there are even more and more owerful RADARS operating now on 70Cms.

Example
Fylingdales (Yorkshire UK) BMEWS RADAR scans 360 degrees in azimuth and 3-87degrees in elevation using a drive power of 2,500,000 watts into gain antennae. This is only one of many 70Cms BMEWS RADARS in the Northern Hemisphere.

Can you convince me that 2M is worse and what is your data source please.

421. LEO Orbits/ Orbital height

Yahoo group: eu-amsat
Date: 2006-02-08 16:25:12 UTC
From: Allan Copland
Topic: 421 Message: 421

Hi folks.

Orbital height is a major factor in many LEO missions.

In a previous posting Trevor said...
> I believe that LEO orbits between 600 and 1000 km are for practical
>purpose no good for two-way radio communication - the pass times and
>the range are too short.

So I guess that rules out the ISS and suitsat as pretty useless right away. They are in a considerably lower orbit!

UoSAT2 is/was near 600Kms. I'm sure it will have decayed a bit through solar activity but its still in the ball park.
On 2M the 400mw fm downlink beacon was 'rock crushing'.

With a LEO bird at 600Kms a horizon to horizon pass were it a linear comsat would give enough time for a proper QSO.
Not ideal ,because it's not a long time, but how long would you want to gab for? If 5 minutes were enough, then 600Kms should do fine.

My understanding is that the majority of CUBESATs also go into low orbits. Are they no good either?

>Orbits around 1400 km (as in Oscars 6/7) or higher (even MEO
4500 km ?)
> are what are needed. Clearly there are radiation issues about 1500
km but the
> use of very simple robust control mechanisms as used on Oscar 6 and
7 may be
> the answer here.

Agreed a 1400-1600Kms orbit would be better and a polar orbit would favour no particular geographical location, covering the whole planet with several windows per day no matter where your location.

A 'FAIRSAT' if you will.

You are again correct - but there are exceptions. You can get on a
non-commercial (research) launch that may put you where you want to go.

> Re challenges. Which is more challenging... a ten minute window or a
> longer one.

I think you misunderstood my meaning of a challenge. If all you want to
do is work a 10 minute window then a double/triple cubesat will do the
job. I was thinking more about the overall mission - not just a single
transponder.

This is true, and we are on notice to change this. It is doubtful we
will be able to orbit LEOs without this facility in the future.

All amateur satellite deorbits to date have been

Give or take a few degrees SO-41, SO-42, NO-44, NO-45 and SO-50. I
think RS-15 is also in a 64 degree orbit.

> Well, I've never been a fan of 'Milestones'. Communications is what

Two-way floats my boat too, but I'm probably equally impressed with data
collection for scientific research. I wouldn't want to launch another
Am-Sat without some experiments, though I would consider that
experimental transponders are still experiments.

> I'm not convinced by that argument.

Unfortunately I live in a place where Mexican taxi-drivers and mountain
residents think nothing of using 100W 2M phones made in China, and
Alaskan (and even local) fishermen think nothing of using 2M rigs they
bought on EBay or at Radio Shack. Perhaps you don't get 2M FM QRM on
FO-29's uplink in Europe, but it's a fact of life here. Conversely we
are constantly fighting other out of band problems in 70cm including FM
starting to appear on VO-52's uplink.

> Can you convince me that 2M is worse and what is your data source please.

I'm on the road at the moment but if you really think it necessary I'll
be happy to forward you all the reports I've filed that have gone into
the OOC's and FCC. It is a real problem regardless of what you might think.

Hello Al,
From the Amsat-bb.

>to build disposable satellites (TossSats) is a very interesting idea. (in
>reference to the ISS).

If this is the direction Amsat choose, I for one will drop satellite operating from the "itinery" and rejoin the bedlam on HF. I seriously doubt anyone would miss hearing La2qaa anyway.

The QTH is not the only reason, I'd still do it even if I lived somewhere where I actually had reception of the ISS. Personally, I see very little difference in waffling to an ISS astronaught on 2m and waffling to LA9VBA (on the other side of the Island) on 2m.

You'll recall the "Why arn't you on the ISS net" mail from the supposed "ISS team" (I deleted it so I can't recall who the sender was) well, I've spoken to the United Nations and the IRAU but they positively refuse! to move Norway 20 degrees further south so that those ISS chappies can work the Island. (You would think these people would have a slight knowledge of orbital mechanics).

While as an amateur I can appreciate the significance of Suitsat and "experiments from space" it does rather remind me of a Norwegian Tony Handcock parody, particularly the dirty laundry tossed out of the ISS bit (though I assume this was probably part of the "thermal" experiment?).

I'm sorry, I just can't take it seriously and the people I've explained it to give me some very strange looks indeed.

From all the "telemetry" suggestions being bandied about I can't help wondering why Amsat don't seem to be interested in another traditional phase two amateur satellite, with a transponder and a fully operative telemetry system. It does seem like the left hand doesn't know what the right hand is doing in the b.o.d. The current Oscar number designation debate being a case in point.

As I mentioned previously, had Amsat obtained the same PR for a reasurrected satellite (AO-7) that they have for Suitsat I believe it would have fired the imagination of more young minds than a grotty old spacesuit full of dirty laundry.

I think it was Luc who asked if the aerial was connected, naturally, 70% of those that replied didn't even realise he was pulling their collective plonkers in his typical Froglish way.

It's a good job there are still people like Luc who attempt to combat the pomposity shown by certain of the self proclaimed "experts".

Hi Folks.

My apologies for being AWOL for yesterday.
I had to attend a funeral.

Emily said
> Well, you are partially right - they go LEO, they don't go HEO.
They go GTO, and you have to get out of the way. Small but
important point.

OK, I concede defeat! Only the rocket upper stage plus its attendant
debris cluster goes to HEO in many cases.
I consider upper stages to be rocket parts and they are usually
listed as such by NORAD. Rocket bodies usually (but not always) end
up in low orbits from which they decay relatively quickly.
Does any of this have anything much to do with my proposal? Its
pretty irrelevant stuff.

> > Unless you want the added complexity of providing a propulsion
system with its attendant cost, scope to go wrong or be compromised
by bad planning or judgements, you are stuck with what you can get.
>

Agreed, there *are* exceptions.

> I think you misunderstood my meaning of a challenge. If all you
want to do is work a 10 minute window then a double/triple cubesat
will do the job. I was thinking more about the overall mission -
not just a single transponder.

Perhaps you never read my original proposal... for 'a single MODE B
transponder low-technology LEO' I also qualified my reasons against
CUBESATS.

I also specifically asked from input from European readers.
The US is out of the linear LEO Phase 2 game. I have been told this
by more than one US AMSAT person.

Your suggestions re CUBESATS are off topic.

>Re deorbiting. I know that major space agencies like to have
eco-friendly rockets but no amateur satellite to date has
incorporated an de-orbit facility.

> This is true, and we are on notice to change this. It is doubtful we will be able to orbit LEOs without this facility in the future.

I'm sure 'we' are. I read some of the articles also.

Re 2M vs 70Cms interference.
Local 100W transmitters on 2M or multiple multimegawatt RADARS on 70Cms.
2M is quiet here.. 70Cms is noisier. From LEO, which would have the greater impact? 100W tcvrs or multimegawatt RADARS?
Both bands have their disadvantages.

Regards.

Al.

Hi Folks.

I'm happy to report that the AMSAT-UK team who worked on the SSETI mission have a new one...The European Space Agency's ESEO satellite.

This will be a new ESA mission carrying a U band uplink and S band downlink.
When the primary mission ends, the mode U/S system should be made available to radio amateurs as a mode U/S Linear Transponder.

The AMSAT-UK team includes G4DDK, G7OCD, G6LVB, G0MRF, & G3VZV who were responsible for the S-Band transmitter on SSETI Express. I'm absolutely delighted at this piece of excellent news.

I'm somewhat disappointed that it will not be of much use to people in developing countries but it will provide a new satellite and provide further valuable flight hardware experience for UK constructors.

I think its spretty safe to say that all of us on the reflector already have heard of Oscar news. I have a large pile of them here in the shack. I've even contributed to them.

For anyone who doesn't know, Trevor is in charge of publicity at AMSAT-UK. At least he was listed as such in 2005*. Who knows, maybe he still heads the publicity department.

Its a great pity he has such a negative attitude towards other people's suggestions. For anyone who is half asleep (and I can't blame them!) I suggest a perusal of the postings on this BBS and the responses to my LEO proposal in particular.

I'd very much like to attend the presentation he mentioned but I'd rather spend the money it would cost to attend on other things such as linear satellites, hopefully including ESEO and paying my council tax. Scotland is a bit a way from the venue.

Comments welcomed (on reflector only).

Hi folks.

You can read a little more re ESEO at

http://sseti.gte.tuwien.ac.at/WSW4/eseo3.htm

This ESA project will carry a redundant(backup) transponder to be built
by the same UK team who built radio hardware for SSETI.

The backup transponder will be activated for use by radio amateurs at
the end of the primary (ESA) mission.

One piece of good news is that this will be a linear transponder and
not an FM Parrot or squawk box.

There is also some data on ESEO at the AMSAT-UK website.

Allan what you clearly haven't realised is that I am a keen supporter of more simple Mode A Linear transponder satellites. What I do object to on the list is the rubbishing of educational projects, linking them with CB and the description of data experimention (PSK-31) as a fiasco.

I wish you well with your satellite project. The Amateur Satellite Community is in need of more Mode A birds but I think we are both agreed the orbit is a critical factor. Oscar 8 carried a Mode A transponder but it's orbit was about 900 km instead of the 1450 km or the earlier Oscars 6/7. As a result it proved less popular due to shorter range/pass time.

Launches to higher orbits tend to be in shorter supply but I'm sure there will be opportunities. One solution may be to use a launch to 600-1000km orbit and then raise the apogee from there, the big drawback is the massive increase in complexity caused by the need for a propulsion mechanism but if we eventually move to an era were there is a requirement to de-orbit then the issue of propulsion will have to be addressed anyway.

Re Trevor's recent posting,

He said..
> Allan what you clearly haven't realised is that I am a keen supporter of more simple Mode A Linear transponder satellites.

Actually I *did* know that. I do pay some attention to what people write.

>What I do object to on the list is the rubbishing of educational projects, linking them with CB and the description of data experimention (PSK-31) as a fiasco.

We set up this list in order to promote a European perspective on Amateur Radio satellites free of political intervention.

If any of the subscribers don't like something , as obviously you don't, then they are free to say so, as you are doing.

>I wish you well with your satellite project. The Amateur Satellite Community is in need of more Mode A birds but I think we are both agreed the orbit is a critical factor. Oscar 8 carried a Mode A transponder but it's orbit was about 900 km instead of the 1450 km or the earlier Oscars 6/7. As a result it proved less popular due to shorter range/pass time.

You are entitled to your opinions. Firstly, I personally did not rubbish PSK31 or compare it in any way to CB although I do wholeheartedly agree with the point that was made re PSK31.

IMHO PSK31 is a completely unsuitable mode for LEO birds although it probably would be suited to Molniyas at or near apogee or HEO birds where the narrow bandwidth and low doppler would be of benefit to the mode. G3PLX also seems to think it unsuitable for LEO's so I count myself in good company.

I do agree that putting a PSK31 facility on a LEO is pointless. Very few people I've talked with before the bird was launched believed it was workable. Why would anyone wish to fly an experiment that was likely to fail? The time, money and resources involved would surely have been better spent in other ways.

Failure or fiasco? I'm happy with either description. If it doesn't work...it doesn't work!

I'm sure if you have read my previous postings you will realise why I am against University 'me too' birds or downlink only birds transmitting telemetry in the amateur satellite segments and

especially on 435Mhz and below..

If they must 'freeload' in the amateur satellite segments, I'd far rather it was on the higher frequencies where bandwidth is abundant and which you are so keen to see utilised. I'd be a LOT happier with that.

Think of the 'educational aspect'. The designers could fly all the high-tech high-risk stuff they liked and nobody else would care.

In short, I say we should keep the valuable and limited lower frequencies for communications... the two way sort.

> Launches to higher orbits tend to be in shorter supply but I'm sure there will be opportunities. One solution may be to use a launch to 600-1000km orbit and then raise the apogee from there, the big drawback is the massive increase in complexity caused by the need for a propulsion mechanism but if we eventually move to an era were there is a requirement to de-orbit then the issue of propulsion will have to be addressed anyway.

I don't consider carrying a propulsion system, especially a dual use one, to be an option and the higher (LEO) orbits are *relatively* uncluttered anyway.

Did you mean a storable propellant system that would raise the orbit at the beginning of life and de-orbit it at the end?
I dread to consider what the reliability of such a system might be. Such systems have been used by the 'big boys' on many occasions and even then, their reliability is very questionable, especially on longer missions. Fuming Red Nitric Acid and Hydrazine have a habit of doing their worst.

I'm *not* putting obstacles in the way of progress. The practical problems in producing a reliable storable propellant system that would work after a long time in orbit (a few years?) are enormous. If we are eventually forced by the authorities to deorbit out dead space junk, how would you propose to do it after a battery or OBC failure... an all too common scenario with AMSAT satellites?
I fail to see how AMSAT could comply with such a directive.

My understanding is that AMSAT currently have a duty to provide a means to disable satellite downlinks at the end of their useful lives. This is a lot less demanding than deorbiting a bird yet even that has been a problem on a few occasions. Thank goodness, or we'd have lost one of our most interesting birds (AO7)! To that you can add some of the RS birds.

Sorry Trevor but I think when something fails, we should call it a failure and try not to repeat the experience. PSK31 on a LEO was a failure and I'm not about to talk it up as anything else.

438. Software Defined Transponder to Fly on Phase 3-E

Yahoo group: eu-amsat
Date: 2006-02-11 15:06:26 UTC
From: Allan Copland
Topic: 438 Message: 438

Software Defined Transponder to Fly on Phase 3-Express Satellite:

The Board of Directors of AMSAT-DL (Germany) plans to fly a Software Defined Transponder (SDX) on its Phase 3-Express (P3E) spacecraft . "This is outstanding news," said AMSAT-NA President Rick Hambly, W2GPS. "The opportunity to fly SDX on P3-Express will provide an early opportunity to demonstrate the potential of SDX in orbit and gives AMSAT-NA the benefit of in-orbit testing before placement on the Eagle-class satellites." Putting the SDX on P3E also will provide a test platform to evaluate its weak-signal processing capabilities that could prove valuable for the Phase 5-A deep space mission that AMSAT-DL is evaluating. Along with improved receiver performance, SDX offers the ability to program configuration changes while in orbit and the integration of uplink and downlink bands via digital connections. AMSAT-UK's Howard Long, G6LVB, will head development of SDX software for P3E and Eagle. AMSAT-NA's Lyle Johnson, KK7P, and Chuck Green, N0ADI, will build the flight hardware, while Bob McGwier, N4HY, and Frank Brickle, AB2KT, will handle integration with the transmitter hardware. "This announcement and the follow on work reinforce the close cooperation between AMSAT-NA, AMSAT-DL and AMSAT-UK as we develop the next generation of high earth orbit amateur radio satellites," Hambly commented. P3E will be placed into a highly elliptical Earth orbit and may launch as early as this year.--AMSAT-NA/AMSAT-DL

439. A different Project Echo

Yahoo group: eu-amsat
Date: 2006-02-11 19:15:26 UTC
From: Allan Copland
Topic: 439 Message: 439

Hi,

Thinking some more about PSK31, Its obvious that tracking the doppler shift is the main issue.

Incidentally I'm *not* serious about this suggestion, but for anyone wanting to use narrowband modes on a LEO, you want to use the lowest frequncies you can. Mode A or K anyone? Since PSK31 can copy signals buried in the noise, maybe an 'Echo' type balloon (passive reflector) could do the job instead of an active transponder. It could certainly be very educational and attention grabbing should that be your thing.

Some of our older readers may remember Echo 1 & 2, silvered mylar balloons (NASA) placed in orbit as passive relays/geodesy satellites. Unfortunately we didn't have PSK31 way back then but if there had been, amateur comms via passive reflector might have been possible. You can see/read more at-

http://www.astronautix.com/craft/echo.htm

Echo1 was a nice easy visual target as it crossed the night sky and probably the most viewed satellite ever. I watched it often. Echo 1 satellite was an 100 foot diameter aluminised mylar spherical balloon carrying a solar powered telemetry TX. Who knows, there may be a place for such ancient technology after all.

440. AO-51 - Working V Up and S down

Yahoo group: eu-amsat
Date: 2006-02-11 20:00:08 UTC
From: IAIN MCKERACHER
Topic: 440 Message: 440

I wonder if anyone else in this group was on AO-51 this evening? I had a guy in Lebanon transmitting continuously on 2M and obviously unable to hear himself on 2401.2MHz. He was 5/9 on 2GHz. Does anyone have contact info for OD5RR?

With many people transmitting simultaneously on the uplink on FM it is nearly impossible to have a successful contact using this mode!

>

What you are describing is typical of FM satellites. I don't think
this sort of problem is about to go away.

On one hand we have the FM birds where uplink power/ antenna gain and
bad operating practice reigns supreme, teaching users (via capture
effect) that more power and worse manners are OK while on the other
hand, with linear birds, *less* power makes things work better.

It must be very difficult (counter-intuitive) for an FM user to
migrate to the linear birds while leaving behind all those bad habits
acquired through operating FM birds.

Then there are the ones who cant hear themselves but keep plugging
away anyway. You'll find these people on both AM and FM birds!

Best of luck with the FM birds. You will need it.

444. 4 Chamber Helical Bandpass filter

Yahoo group: eu-amsat
Date: 2006-02-12 15:43:51 UTC
From: Allan Copland
Topic: 444 Message: 444

Hi Folks.

For anyone bothered with 2M pager breakthrough, one of these filters could be useful for you. I've owned one of these for over two years and can highly recommend them.

You'll find my review in the 'Observations from Scotland pages' at

http://www.observations.me.uk

The filter is a 4 chamber self resonant helical type with aperture coupling. Insertion loss is miniscule and it is very effective in stopping overload of your transceiver's front end by high powered pagers etc. You can of course transmit through it with absolutely minimal loss. The build quality and performance are excellent.

Hi Allan,

I guess, indirectly, I was questioning the viability of FM satellites. The problem is that there are

not many satellites operational in orbit with linear transponders. I have the ability to run a lot of

power on all modes but it all seems a bit pointless on FM satellites.

Personally I think FM satellites are a waste of time and, money should not be wasted launching

them.! I much prefer the linear transponders on FO29 etc. I did a lot on AO-40 and felt that it

was the ideal platform in an ideal orbit!!

Hopefully the Germans will soon give us something similar and perhaps even better.

Hi Iain.

You said..
> I guess, indirectly, I was questioning the viability of FM satellites.

Well Iain, I think you are only noting what many have been saying for a long time. If the users just accept the decisions made to fly inappropriate technology then there will be more of these birds. I voted with my feet over that issue and left AMSAT-UK after they helped fund an FM mission. I joined AMSAT-India where at least I could at least contribute to a linear transponder bird. Don't forget that you always have a choice.

What worries me most is not the use of FM, which in itself is an inappropriate modulation scheme for satellite use, but the message it gives to users that bad operating practice and plenty of power is the way to go.

There also the matter of University birds using amateur downlinks on what are effectively commercial missions. If all they want to do is collect telemetry, why not use the microwave bands instead and leave the lower bands for two way communications between human beings.

Have a read at http://www.observations.me.uk/Satgen/sgen268.txt
You may remember John (GM4IHJ) Branegan's excellent satellite archive.
He noted the problem of 'me-too' sats as long ago as May 1994.

I think Mak was wondering why the majority of amateur
satellites are in LEO.

In a word Mak, money!.

To expand, simply, that's where the space vehicles
are going these days. Don't forget, amateure satellites
are almost never primary payloads, we have to hitch a ride
on whatever is available at the time.

HEO's would be preferable but it's a bit like Mozambique,
Everybody knows where it is but nobody's going there.

GM1SXX is the brainy one (he claims to have at least three
active braincells). He'll no doubt give a more eloquent
explanation than I can.

My excuse is that I'm down to my last remaining active braincell
and even that one's about to go open circuit.

There is of course always the possibility that a certain PH7
station from the lowlands could "donate" the price of a cheap
HEO rocket.

Remember the old adage though.

There's no such thing as a free lunch ... (launch).

To this I'd add that there is the issue of orbital inclination.

Arianespace built their spaceport at Kourou (near the equator) to service the Geostationary COMSAT market. The Russians, with the Baikonur, Plesetsk and Svobodny launchsites have greater flexibility. Plestsk (AKA Northern Cosmodrome) was built to serve the need to launch polar satellites efficiently while Baikonur Cosmodrome and Svobodvy can better serve lower latitudes. Baikonur is Russia's primary spaceport but unfortunately with the breakup of the Soviet Union is no longer on Russian territory and so has to be leased from Kazakstan at great cost.

This was the reason for a partial move to Svobodny, an old military launch site. RS16 AKA Zeya , was lauched from there and was named for the nearby river Zeya.

RS16 used a small 64Kgs 'STRELA' structure. Strela is the Russian store-dump satellite systems used by the Russians for battlefield communications. The Strela satellites were launched in 'octets', 8 satellites from each Kosmos launcher. Like the AMSAT Microsats, small differences in drag spreads them out through the orbit plane. Not much data has ever been plublished about the easly RS birds (RS3-8) but it is very likely that they used the small Strela bus.

Satellite launches are very expensive so as secondary 'passengers' we don't get to choose the mission details such as inclination and orbital height.

LEO satellites vary greatly in their footprint from the low orbiting-small footprint birds lobbed out of the ISS or space transportation system to birds like AO7 or even higher near circular orbits.

The Russian's and Europeans are collaborating in a number of projects and things could get very interesting in the relatively near future.

John, if I could, I certainly would donate it. But it's simple, I can't.

On the other hand I would prefer a HEO or a MEO over a LEO as it would have bigger advantages for the sat hobby. I have read many articles about AO-40 lately and found out that at the time a was still wearing dipers a lot of serious dx-activities was going on there. Unfortunately I've missed all that fun. To raise interest for the satellite hobby I would say focus on a higher orbit sat.

Hi Aldert, I believe there are already two Heo's in AMSAT plans.
Eagle and P3E are both listed as HEO's.
http://www.amsat.org/amsat-new/express/
http://www.amsat-na.com/donation.php

How many do you need? You can only work one at a time :-)

Much depends on what you want out of the hobby. Do you think there should be more than two HEO's?
Many users like the challenge of LEO birds. Doppler, tracking and operating.
The AMSAT NA site's donation page lists Eagle 1&11... perhaps there will be two Eagle HEO's? A HEO bird is generally far more complex than a LEO and there are therefore many more potential failure modes.

Kind Regards,
Al.

POWER.

How much is enough?.

There could be many answers to that question but the correct one regarding amateur satellite communications is, "Just enough to maintain effective communications".

For instance, how many people reduce their power as the satellite they're operating on approches TCA (time of closest approach). A good operator will, because they know that the use of excessive power is *not* good for the transponder.

Case in point. When AO-7 first comes up over the horizon you'll probably need "X" amount
of power to communicate effectively. However, after 10-15 minutes, as the range decreases
you'll find that a 3dB (50%) reduction of power will have no effect whatsoever on the signal.

A *VERY* sensitive S-meter might show a difference but your ears certainly won't.

Hands up those that actually regulate their power to maintain effective communications.

(No, I didn't think so).

You should try it sometime, you might get a surprise.

By the way, we do know (don't we?) why most satellites have a beacon?.

The principle reason for a beacon is so that you can regulate your power to be consistent with that beacon, it's your reference. No signal should ever be more powerful than the beacon. That's what it's there for. Naturally, it will also serve as your propagation reference.

The basic principles of aerial gain are explained at ...

Al,
Two of the reasons I didn't compose a table for HEO v LEO comparisons of power are ...

1) The permutations are endless.
2) A power reference is always included (or should! be) on a satellite anyway, namely, the beacon.

It would be pointless to make up a table referencing for instance the now defunct AO-13 or AO-40 satellites because each satellite (and orbit) is individual in it's requirements regarding power.

To date, not one single satellite has been operated with the "recommended" amount of power,
there are simply too many variables, not least of which is the state of the propagation, aerial gain, location, and receiving equipment. Therefore IMHO it would be unwise to make a list of the "recommend" amount of power needed for a particular satellite or orbit.

The beacon is the reference. As I mentioned, "enough power to communicate effectively" and
"no signal should ever be stronger than the beacon" is in my opinion adequate.

This implies that if you can't hear the beacon well enough (assuming the satellite is working properly) you need to improve your receiving capabilities, and you should regulate your power so that the downlink is consistent with the beacon.

Note that I said: "assuming the satellite is working correctly". Any deviation from the norm: due to either propagation, range or orbit and you should regulate your power with the beacon as your reference.

73 John. <la2qaa@...>

454. Addendum.

Yahoo group: eu-amsat

From: John Alan Hackett.
Topic: 454 Message: 454

A point to ponder.

Another reason why a list of power levels is not recommended for satellite operations.

When operating via a satellite don't be surprised if you receive a signal report of 439 when you're hearing yourself at 579, there can be reasons for the discrepancy. It's not always the S-meter or the other persons aerial "at fault".

Remember that satellite signals are passing through the ionosphere twice! and the current density of the ionosphere may be quite different between you and the satellite and that of your QSO partner and the satellite.

In addition to gain, it's important to address the issue of polarization, something I have struggled with presenting in the past. I've recently upgraded my Sat Intro presentation to include this topic and I hope the diagrams will prove helpful.

The entire presentation is at:
http://www.planetemily.com/n1did/presentations/SatIntro2006.pdf

(Adobe Acrobat - 1.45MB)

In particular the discussion about polarization begins on page 30.

458. Polarisation myths.

Yahoo group: eu-amsat
Date: 2006-02-16 09:30:42 UTC
From: Allan Copland
Topic: 458 Message: 458

Hi Folks.

As Emily noted in her online AMSAT presentation.

A linear mismatch between antennae will result in a loss from 0Db to 20Db (at 90 degrees error)
A circular mismatch (between RHCP and LHCP) also results in a -20Db loss.
A mismatch between circular and Linear will result in a 3Db loss

So the worst situations you can create is to use linear polarisation with a linear bird (antenna rotated 90 degrees) or to use an LHCP antenna with a RHCP bird ,or a RHCP antenna with an LHCP bird.

In all such cases, the *theoretical* mismatch will cause a 20Db signal loss.

The BEST case mismatch is to use CP (any polarisation) with a linearly polarised antenna (or vice versa). This only results in a fairly insignificant 3Db loss. This is worth remembering!
This loss is also theoretical. I

If should be remembered that ALL the cases listed above are theoretical figures based on optimal conditions.

In the real world, things are not so straightforward. Here's why.

Rarely are satellite and groundstation antennae directly pointed at each other. In general, there is a measure of pointing error or 'squint'. This is important to consider.

In such a case, and thats most of the time for most users ..with the possible exception of Molniyas under certain conditions when they are accurately earth-pointed, the polarisation 'seen' by the receive or TX antenna on the ground will *not* be CP. It may be elliptical but it can *not* be CP and its called 'squint angle'.

To state a point that everybody who uses CP birds should know. Polarisation is ONLY CP down the boresight of the antenna(e). In *all* other cases, it is NOT CP.

Somewhat interestingly, the best of a bad lot is the situation where one end of a link (usually the satellite) uses CP while the groundstation uses linear polarisation. This causes the least signal loss of all mismatch conditions.
Remember that... CP to linear or Linear to CP is the 'best' mismatch condition. It could even save you money... on aluminium!

When I started monitoring satellites (both amateur and commercial) I used expensive commercially made CP antennae. Being the generally distrustful sort, especially when it comes to parting with money, I wondered what difference there would be if I switched to ordinary linearly polarised types. Somewhat to my surprise, there was very little difference and it taught me a lot along the way.

Take a CP bird and a handheld linear antenna. You can see this in action with any Arrow user. The polarisation veries throughout the pass and your 'Arrow' man will be talking and twisting his antenna for the best polarisation match *at that moment in time*.

I learned this long before FM birds and Arrows came along.

FACT... the polarisation on a CP LEO bird changes continually during a pass.
(Otherwise those Arrow guys are kidding themselves).

FACT... the polarisation can only be CP when groundstation antennae and satellites antennae are pointed DIRECTLY at each other.

In reality, depending on the frequency used and solar activity, even that can change... faraday rotation and scintillation.

So, CP or linear antennae? Take your pick. The reality is that it doesn't much matter (3Db worst case) and if you do go for CP, be absolutely sure it has the correct sense or you will be looking at a 20Db loss, but even that only theoretical!

For myself... I use linear. I've used it for many years.

73 Al.

From: Jean-Jacques DE REY
Topic: 458 Message: 459

Hi Al,

After 20 years operating on SATS, I can completely agreed with you.

I abandoned the circular polarisation after I did some tests 'how circular' my polarisation was !

During these tests, much to my surprise the commercial products offering 'CP' antennas complete with phasing harness do not produce a clean CP pattern, it is very elliptical ...

I then tried to do it myself (Yagi, turnstile, ...) but I couldn't do better. Either the polarisation was not circular, either the SWR was out of normal limits...

I concluded that (in practice) generating a CP on basis of linear antennas is a non-sense. If you really want CP, well then go for an antenna where the mechanics are circular .... like a patch antenna or helix - these are OK !

So since 20 years I am using a pair of linear antennas, both for TX as RX.

My advise would be to purchase 'circular' antennas, but do not use the phasing harness. Instead, run to your shack with 2 coax lines (or make it switchable at antenna with relay) and select either polarisation. The possibility to switch over is essential on some birds/ conditions (e.g. AO-7 when low over horizon... it really makes a difference of working DX or hearing 'nothing'!) I know that in the past there were some 'magic boxes' available where you could select from the shack either of 4 polarisations (H, V, RHCP, LHCP). This smart box was off course connected to the antenna by 2 lenghts of coax of same lenght, I don't know if they are still available and have no experience with them...

See you on the birds and vy 73!

A linear mismatch between antennae will result in a loss from 0Db to
20Db (at 90 degrees error)
A circular mismatch (between RHCP and LHCP) also results in a -20Db loss.
A mismatch between circular and Linear will result in a 3Db loss

So the worst situations you can create is to use linear polarisation with a linear bird (antenna rotated 90 degrees) or to use an LHCP antenna with a RHCP bird ,or a RHCP antenna with an LHCP bird.

In all such cases, the *theoretical* mismatch will cause a 20Db signal loss.

The BEST case mismatch is to use CP (any polarisation) with a linearly polarised antenna (or vice versa). This only results in a fairly insignificant 3Db loss. This is worth remembering!
This loss is also theoretical. I

If should be remembered that ALL the cases listed above are theoretical figures based on optimal conditions.

In the real world, things are not so straightforward. Here's why.

Rarely are satellite and groundstation antennae directly pointed at each other. In general, there is a measure of pointing error or 'squint'. This is important to consider.

In such a case, and thats most of the time for most users ..with the possible exception of Molniyas under certain conditions when they are accurately earth-pointed, the polarisation 'seen' by the receive or TX antenna on the ground will *not* be CP. It may be elliptical but it can *not* be CP and its called 'squint angle'.

To state a point that everybody who uses CP birds should know. Polarisation is ONLY CP down the boresight of the antenna(e). In *all* other cases, it is NOT CP.

Somewhat interestingly, the best of a bad lot is the situation where one end of a link (usually the satellite) uses CP while the groundstation uses linear polarisation. This causes the least signal loss of all mismatch conditions.
Remember that... CP to linear or Linear to CP is the 'best' mismatch condition. It could even save you money... on aluminium!

When I started monitoring satellites (both amateur and commercial) I used expensive commercially made CP antennae. Being the generally distrustful sort, especially when it comes to parting with money, I wondered what difference there would be if I switched to ordinary linearly polarised types. Somewhat to my surprise, there was very little difference and it taught me a lot along the way.

Take a CP bird and a handheld linear antenna. You can see this in action with any Arrow user. The polarisation veries throughout the pass and your 'Arrow' man will be talking and twisting his antenna for the best polarisation match *at that moment in time*.

I learned this long before FM birds and Arrows came along.

FACT... the polarisation on a CP LEO bird changes continually during a pass.

(Otherwise those Arrow guys are kidding themselves).

FACT... the polarisation can only be CP when groundstation antennae and satellites antennae are pointed DIRECTLY at each other.

In reality, depending on the frequency used and solar activity, even that can change... faraday rotation and scintillation.

So, CP or linear antennae? Take your pick. The reality is that it doesn't much matter (3Db worst case) and if you do go for CP, be absolutely sure it has the correct sense or you will be looking at a 20Db loss, but even that only theoretical!

For myself... I use linear. I've used it for many years.

Hi Jean-Jacques,

It is a sad fact that many commercial CP crossed yagis with their
associated 'phasing harnesses' don't provide very acceptable CP.
I'm sure that LA2QAA can explain more, he knows a lot more about
antenna systems than I do. I only dabble but it used to be John's
'day job'.

I came to the same solution as yourself re polarisation in that I use
a pair of switched linear yagi antennae for 70Cms and have a co-ax
switch in the shack to select the active one.

Another option is the 'polarphasor' but I have not seen one for years.
In essence the Polarphasor allowed phase delays to be programmed into
the system. It was a simple device containing a printed delay line
connected to a multipole switch. I owned one for a while before I
went back to separate V + H antennae.

I spent quite a bit of time experimenting with NOAA WX sats and
amateur birds with a variety of antennae. I tried linear yagi,
crossed yagi/delay line, turnstile reflector with delay line and even
a simple hairpin over a ground plane of chicken wire. I found that it
didn't much matter what I used. At that time I liked dabbling more
than operating and to a large extent still do.

IMHO It *does* make sense to have CP on the bird, whether amateur or
commercial. You then have the option of using almost any antenna you
choose except for a CP antenna of the wrong sense. That is the worst
case scenario of all. Having CP on the bird ensures that almost any
antenna will work acceptably given that it has adequate gain.

One point I'd make is that most amateur satellites are small in terms
of wavelength (for the lower bands) so they won't make effective
reflectors for a monopole/reflector with delay line style of antenna

as is carried on many of them. Think of the implications of that with regard to CP.

From the satellite's end, regarding CP, its far easier on a satellite to generate a proper CP signal at the higher frequencies using an axial mode helix or dish. There are restrictions there also in terms of size and space. You need a reasonable number of turns on such a helix because the feed structure will skew the pattern. Patch type antennae are also becoming increasingly popular for the higher frequencies.

OK Al,

When you mentioned the NOAA sats, it came into my mind that in the list op 'perfect' CP antenna's by construction, I forgot to mention the QFH (Quadrifilar Helical).

Next to the QFH, forget about turnstiles, Lindenblad, ... ;o)

I use the QFH for reception of ISS APRS (Satellite Internet Gateway) and NOAA's (see http://wxsat.shacknet.nu:443).

I guess that with adequate power this antenna could perform very well for LEO uplinks as well.

>

Indeed. I can think of no reason at all why a properly built QFH would not serve very well as a LEO ONNI antenna.

My only excuse for not trying the QFH is that it involves a bit of work, (that 4 digit 'swear' word) unlike simple T/R's and the like.

QFH's DO work. I've used ones made by Spembly in the past (for WXSATS). In many ways they are the perfect LEO antenna because of their polar pattern, providing a consistent signal from horizon to horizon.

Lindenblads can't be all bad. Our local airfield (Glasgow International) has a forest of the things. In some ways aircraft are like satellites... you can never know the signal polarisation at the groundstation, so CP on the ground makes a lot of sense in that situation.

The point I'm making is that CP at ONE end of an unpredictable (with regard to signal polarisation) link always makes sense. Max theoretical loss is 3Db's, and with satellites, it makes the greatest sense to put CP on the satellite rather than at the groundstation.

Hello J.J.
I wholeheartedly agree with your latest posting and wrote much
on that very subject many years ago in my column in Oscar News.

I don't believe we'd be doing potential newcomers a favour by teaching them
about the mechanics of circular polarisation, on the contrary, I seriously
believe we'd be giving the impression that satellite operating is a bit more
difficult and expensive than it actually is.

I've also done a fair bit of research with phased arrays and circular
polarisation but elect to use an elliptical polarised array myself ... at
least on LEO's.

I wrote about the circular polarisation/boresight only phenomonen in an
article for the original "Satellite for Dogs" book many years ago ... now
rechristened "Observations" ... online at ...

<http://www.observations.me.uk/DOGS/ANTENNA%20SYSTEMS.htm>

I elected *not* to write about polarisation so as not to cloud the issue for
the potential newcomer.

It's my experience that many people often confuse polarisation changes with
other propagation anomolies. As you correctly state, it's extreemly
difficult to acheave true circular polarisation from linear polarised
aerials. I've been at it for 39 years and still havn't managed it.

You'll also obviously know that to come anywhere near to understanding
what's really going on a simple MFJ antenna analyser just isn't enough. At
the very least, the measurements have to be made in the far field of a
transmitting aerial and a genuine antenna test range is the minimum
requirement for this. Any measurements taken in the near field of a
transmitting aerial will be false.

You probably also know that commercial aerial manufacturers use 100Mhz
"models" and scale their designs. The worst case I've seen being a large
chunk of carbon to "doctor" the impedance ...
(which, while it presented a match, didn't add a too much to the radiation
efficiency, hi).

I believe certain people made certain assumptions 40 years ago and a lot of
people just jumped on the bandwaggon ... particularly the aerial
manufacturers. Adding a little mistification = more sales.

In English we say ... "Blind 'em with science!" ... or ... "If you don't
know what you're talking about,
just waffle!" ... I'm referring to certain aerial manufacturers with their

magic aerials who very often
attempt to change the laws of physics to suit their designs.

>In all such cases, the *theoretical* mismatch will cause a 20Db signal
>loss.

and also wrote:

>If should be remembered that ALL the cases listed above are
>theoretical figures based on optimal conditions.

Yes indeed - it is theoretical, as is almost anything to do with antenna gain. (I am fighting this battle with my three year old yagis that have been bounced, bent and are nowhere near the theoretical gain when they were new.) I think when one is trying to design/select antennas for any purpose you design for the theoretical best case (optimal) scenario. Designing for the worse case scenario (IMHO using an eggbeater) seems anti-productive.

Al went on further to say:
>To state a point that everybody who uses CP birds should know.
>Polarisation is ONLY CP down the boresight of the antenna(e). In
>*all* other cases, it is NOT CP.

I believe what you are describing here is the case when the e-field and h-field are not matched in shape and/or are not exactly 90 degrees out of phase, which causes the wave to appear to be an ellipse. I have not been able to find out what effect an elliptically polarized wave has on a circular or linear receiving antenna, however if I had to guess I would guess the loss between similarly matched (RHEP into RHCP or LHEP into LHCP) is likely to be up to a -3db loss. So for a low earth orbit nadil pointing CP satellite, anyone experiencing a squint angle greater than the 3db beamwidth of the transmitting antenna would probably experience elliptical polarization thus potentially pushing the loss up to -6db. However as Al points out...

>The BEST case mismatch is to use CP (any polarisation) with a linearly
>polarised antenna (or vice versa). This only results in a fairly
>insignificant 3Db loss. This is worth remembering!
>This loss is also theoretical.

I generally agree with this and ...

>For myself... I use linear. I've used it for many years.

I also use linear (2M=H, 70cm=V) for a number of reasons that have to do with designing the best array for the available space (the balcony off the top floor of my townhouse.)

http://www.emilyshouse.com/gallery/AntennaPix/Antennas

The antennas are high gain for their size (both antennas less than 1M in length) and weight (both under 1Kg) and have very good 3db beamwidth (60 deg) so I can use a fixed elevation (1/2 the 3db beamwidth) and rotate by hand. I have excellent coax (LMR-400 ultraflex) and can turn on preamps on either band if needed. These help keep all the signals up into the S9+ range on any LEO. (John has listened in over Echolink and can attest that signals don't fade below full quieting until the satellites drop below ~7 degrees, caused mostly by thick trees and mountains.) AO-51 is a very good example of a satellite that transmits circular, but depending on which transmitter (A or B) is used it may be transmitting RHCP or LHCP. So why fool around with switching polarity when linear will work just fine?

I did a test about a year ago trying to get two identical 70cm yagis to exhibit the theoretical -20db loss when set at opposite polarity. I don't have a chamber so the test was run across a soccer field with a 1mw carrier at 440MHz at one end and a spectrum analyzer at the other. I was never able to get the signal more than -8db regardless of how exacting I tried to mis-match the two antennas. I'm sure part of the reason why was that signal was bouncing off the ground and other places, but my guess is that is very similar to any other real-life situation IMHO. So when people tell me that two linear antennas are going to be up to -20db it doesn't frighten me. In practice I don't believe it will ever happen.

Emily

Topic: 458 Message: 465

Hi,
Thirteen years ago or thereabouts, I used to live in a communal block of flats which fortunately for me had good neighbours who allowed me to put up a DIY 'tilt-over' tubular 'mast' on the rear of the building to take my 8ele 2M beam and 2 * 8ele 70cms ones. This thick-walled 'mast' was trashed in a ferocious storm storm which brought the whole lot down to Earth (the 'mast' actually failed in the middle through overloading) trashing my antennae. There was a horrible loud groaning noise followed by an almighty crash! Being of Scottish parentage, I did not want the expense of buying a new set of beams so I salvaged what I could .. the booms and insulating spacers mainly, and made a new set of directors, driven elements and reflectors for the booms. It seemed like a good idea at the time.

The antenna systems were/are all of the ZL-yagi type. For anyone unfamiliar with this type, they use folded dipole driven elements and reflectors with the reflector driven in anti-phase. This makes for a compact beam with a good F/B ratio.

The tubular aluminium for the replacement elements came from the local DIY emporium. Since the original elements were mangled, I had to do more than a little 'guesstimation' as to the element lengths. The toughest part was re-making the folded dipole driven and director elements for the three beams. I had to make a wooden bending jig and fill the tubes with sand to avoid kinking them. I persevered and they turned out pretty good. I replaced the original zinc-plated fixings with stainless steel ones. That was around 13 years ago and I still have those antennae, now as stealthy types hidden inside my attic 'radome'. I'm glad I rebuilt them now because they work pretty well. You don't want to know what else is in there, its a veritable rat's nest of aluminium and wires.

I agree with Emily's comments re the theoretical nature of antenna measurements. To do meaningful work, you'd need a proper test range and the associated equipment.

I do think that antenna polarisation is a greatly over-emphasized area on the amateur satellite scene.
My own personal experience is that linear works fine in most situations and if one has the space, switchable crossed yagis can be of some benefit. I suspect that many natural effects such as ducting, scintillation and faraday rotation are mistaken for polarisation problems when the truth is somewhat more mundane.

Have a good weekend.

Al,

Yes I know 2 (or 3) HEO's are skeduled and those 2 or 3 would be
enough for for me. The only thing is there's no HEO now, and having
missed the fun of a HEO, I would go for that one.

> How many do you need? You can only work one at a time :-)

Yes correct. But how many LEO's do you need then? I count 3 linear
LEO's and 3 FM birds.

> Many users like the challenge of LEO birds. Doppler, tracking and
> operating.

Yes must say it's quit a challenge to manually correct the doppler,
track sat and operate. Having some sotfware yet to correct the
doppler and having (in due time) a rotor tracking system, that would
leave operating. Yes that's the thing I prefer to do Al. Must be my
lazy nature.

I pulled the following from a post on the Amsat-bb yesterday.
It's an example of how *not* to teach the potential
newcomer.

<so you will need an amp for 2 meters for
<Mode A and J, and a 70cm amp for Mode B on AO7.

You *DO NOT* need an amplifier for mode-B on AO-7 ...
unless of course you really are only transmitting 10w to a length
of wet string through more than 150 meters of RG-58 on 70cm ...
(with SO-239 connectors).

I would suggest the author of the above statement (callsign
intentionally omitted to preserve world peace) read the recommended
operating proceedure for AO-7 at ...

<http://www.planetemily.com/ao7/redirected.php>

There is also an explanation of why! you shouldn't use excessive
power.

See also <http://www.observations.me.uk/howmuchpowerisenough.htm>

Hi Folks,

Regulars will all know this site but for the benefit of newcomers who may be looking for ideas for amateur satellite antenna systems, have a look at Jerry Brown K5OE's website where there are a lot of ideas and easy to build designs.

http://members.aol.com/k5oe/

Why spend money when you can build antenna systems from junk!

At the weekend I was looking for a new project so I built one of Jerry's 70Cms Quagi's. It works well and is very simple to construct. For the elements I used 2mm diameter aluminium welding wire and for the reflector and driven elements I used some copper wire stripped from mains cable. My boom was a piece of 18mm square pine I found lying in the back garden. This Quagi will join my 2M 8ele ZL-Special yagi on an azimuth rotator in the attic.

I like this antenna so much that I plan to build another one soon, this time for 'hill-topping', perched on top of a fibreglass fishing-pole.

(>
>and was suprised at how few reports they've had so far, only 31 !! Surely
>there must be more than 31 AMSAT members World-Wide who've heard it ?

Err ... it couldn't possibly be that some operators couldn't give a rodent's bum about another university (digital) picosat, where the minimum requirement to transmit is at 23cm in a LEO orbit.

could it?.

Or perhaps the fact that a lot of operators simply don't have the 23cm 9600bps equipment needed to transmit the odd frame or two, and therefore say to themselves ... for the amateur community?, but how many of them?, I'm not investing/constructing new equipment for this.

(I belong to the latter).

Before anyone replies with ... try 9600bps before you comment ... I did, many years ago and found it extreemly boring.

OK, I know the satellite was designed to test the "new" (!) technology ... (like Ronseal, "It does what it says on the tin") ... but a transponder that would have been actually used by more than 40 amateurs worldwide might have been an idea.

Did the designers learn nothing from the old Pacsat experiments?.

Well, it's one way to justify the use of "unused" amateur frequencies.

Just a thought.

Topic: 473 Message: 473

To the gentleman with the habit of calling CQ on the top of other stations already in QSO ... (he knows who he is) ... I won't type the callsign, in an attempt to preserve world peace.

Sir, why do you call CQ on top of other stations who are already using the frequency?. Normal amateur satellite operations use the full duplex mode and even if you can't hear one end of the QSO due to propagation anomolies it's very unlikely you can't hear both ends of a QSO in progress.

The trick is to LISTEN before you transmit ... and also make sure you can actually hear someone when they answer you. Ignoring them is very impolite.

Normally I wouldn't mention it on this reflector but it does seem to be a habit with this one particular station calling CQ on top of QSO's in progress.

After having moved several Kc/s to a clear frequency to complete the QSO only to find we're still being QRM'd by the same station suggests either a lack of an adequate receive system or that it's being done deliberately.

It's not enough to just transmit ... you need to be able to receive your own downlink, especially when two other stations are already operating on that particular downlink frequency.

If other people answer someones call that means that they can copy the transmitted signal ... which also means that everybody else should be able to hear it too.

There's plenty of room on AO-7 so It's not necessary to transmit a signal so that the downlink appears on the top of other station's who are in QSO.

I apologise if this mail sounds like "sour grapes" ...not my intention ... the object of the exercise is to make one particular station aware of good operating proceedure and gentlemanly conduct on a full duplex linear transponder.

From: john hackett
Topic: 474 Message: 474

Hi All,
Re: the mode-A v mode-B debate.

The AO-7 log <http://www.planetemily.com/ao7/ao7log.php> speaks for itself ... especially considering the satellite has switched between modes A & B every 24 hours for the last few weeks.

Of course, the equipment available in the shack has something to do with it but none-the-less, the entries in the log speak for themselves as to which of the two modes is the more popular among the general populace of amateur satellite operators.

(The experienced operators are of course aware of other reasons why mode-B is preferred).

Just thought I'd bring this interesting fact it to your attention.

Well for what its worth, I'd rather these 'me-too-sats used the
relatively quiet microwave bands rather than the lower bands where
most licenced radio amateurs hang out.

Look at it this way, using microwaves, even the so called 'DC bands'
would relieve the demand for valuable frequency allocations on the
lower bands. It would give the geeks and 'designers' in Universities
a challenge and maybe even result in some progress in digital modes.
(I wonder if they have included PSK31?)

Being serious for a minute, all this has been said before... GM4IHJ
was warning of the hijacking of the amateur bands many years ago.

479. An Observation.

Yahoo group: eu-amsat
Date: 2006-03-16 19:22:34 UTC
From: john hackett
Topic: 479 Message: 479

An Observation from Norway.

2m and 70cm knife-edge propagation is a well known phenomenon for those that live in mountainous areas.

Theoretically, from my QTH on Frei Island I shouldn't be able to work North America on a low earth orbit satellite due to the proximity of the extreemly high mountains from N.N.W. of my antenna array to S.S.E. and since antipodal propagation is not as common this far north as it is nearer the equator the chances of satellite DX on a LEO are minimal ... though almost permanent auroral propagation makes life interesting via satellite ... remember, the signal traverses the ionoshere twice!.

That being said, by careful monitoring of a tracking program it is possible to find an AO-7 orbit where knife-edged propagation could be used to "sneak" around the edge of the mountains.

Bearing in mind an average 2 x 6 array has less than the more common 3dB half power point the "aiming" has to be fairly accurate. For the newcomer this means that only half of the uplink power will actually manage to scrape around the mountain ... (reflection and refraction also has to be taken into account, likewise eventual ground gain) ... therefore, there are a lot of variable to contend with ... not least the idiosyncracies of the ionosphere as well as the polarisation of the signal.

However, being an AO-7 afficiondo I've been trying for quite some time to defeat these mountains and get into the States while working AO-7.

Imagine my surprise therefore when after repeated CQ's I finally heard LA2QAA de K8DID.

I used to work the States daily on AO-13 but a relative LEO like AO-7 is a different matter from this particular QTH on Frei Island. JP33WB.

The moral of the story? ... don't give up, give it a try, you never know.

It was well worth the effort.

Good 'un! Ron mate!.

Nice one!,
Congratulations, the gentleman putting the high powered permanent carrier on the CW stations using AO-7. Welll done!, that's the way to do it ... unfortunately it didn't work and the stations were able to complete the QSO.

May I respectfully suggest you increase your power a bit, it also helps if you groan
"AWWWWWWWWWWLLLLLLLLAAAAAAAAAA" on top of the stations using the frequency. That ought to give you pleasure ... (not that it will stop a clean QRP CW signal).

Err, what did you say full duplex meant?, I've forgotten.

Hi Emily, I may indeed be the only person to think that OSCAR numbers have outlived their usefulness, who knows, but 'probably' only informs me that you disapprove of my thinking. I would like of course to know what others think.

Like OSCAR numbers, there is no information present in your answer. That very point is what's wrong (IMHO) with the continued use of OSCAR numbers.

Think about it for a minute.

1) OSCAR numbers tell users nothing about the satellite they are using.

2)It is just another layer of pointless information to remember that we don't actually need. Whats wrong with a *single* satellite name?

3)If you think we need OSCAR numbers, why not allocate them before launch. At least there would only be one satellite name for each bird doing the rounds.

4) There is no legal requirement for using OSCAR numbers whatsoever. The IARU will happily co-ordinate frequencies etc for satellites with no OSCAR designation. In fact this is how it normally operates anyway. The Oscar numbers (if they happen) comes later.

5) There have been quite a few amateur satellites with no Oscar designations at all. Did that actually matter? The world did not come crashing down around us because of their lack of an OSCAR designation.

6) Increasingly, 'amateur' satellites are being built with little or no input from AMSAT. University 'me-too' birds carrying a token amateur radio presence (such as downlink only telemetry in the

amateur bands) are threatening to replace AMSAT built birds as the main users in the amateur satellite segments. Giving these birds Oscar designations is IMHO encouraging the rot.

Come on Emily, I'd like to hear your opinion. 'Probably....' does not constitute an opinion. At least, I hope it doesn't :-)

Regards,
Al.

Hi Al,

You wrote:
"...but 'probably' only informs me that you disapprove of my thinking. I would like of course to know what others think."

You are making a very big assumption here. I neither approve of your thinking nor disapprove of it - that would be judgmental and wrong since we don't know each other well, and you didn't invite me to make a judgement about your thinking.

The original question you asked was:
"Am I the only person who thinks that OSCAR Numbers have outlived their original purpose?"

I responded by saying "probably" because I believe you might be alone in your thinking. I didn't say "definitely" because in a world of 6.5 billion people there is likelihood someone else thinks like you, though whom I cannot say - I don't know them. I do know people who have spent time thinking about it and generally disagree with you, though there are others who have not formed an opinion and others who may not care.

I considered responding with "possibly" or "very probably", but decided "probably" was closer to what I think is the correct answer.

Regardless of what I think after reading your website, the questions "What did you think of the points I raise on my website?" "or "Have OSCAR Numbers outlived their original purpose?" wasn't the question you asked on the reflector. I would have given a different answer to either of those questions.

If the answer you expected isn't the answer I gave, don't shoot me for responding to the question you asked.

73,

Emily

Hi All,

Only Emily and Luc have thus far bothered to answer the question I posed. A couple of members expressed their opinion off the record. I'd much rather their response was posted here.

I'm sure others will have opinions, but rarely does anyone post their thoughts and ideas here.

Are Emily, Luc and myself the only ones with an opinion about OSCAR numbers? Remember folks, you can even respond with 'I don't have any thoughts on the subject' if you wish... that also constitutes an opinion.

Mak, John and myself set up this group in order that ideas could be freely exchanged, suggestions made and opinions sought.

I have tried in the past to gauge opinions on a number of subjects. Most have only had a response from a few few members, and almost always the same members.

Although this is quite a small group (53 members) it would be good at times to have some feedback from people other than the obvious ones (they know who they are). Their input is appreciated, but what about everyone else in the group? Do you not have opinions or ideas to share?

Al,
you have absolutely right, but that you above mentioned is not a
"phenomenon"
only into Eu-Amsat. Few days ago I posted a message with some kind of
"trap".
The "trap" was a page with a "hidden" counter. By checking later the
counter in order to count the visitor's number, I completely surprised with
low-response of ... Amsat-BB members (yes, was there my test !), which is a
very large reflector compared with Eu-amsat reflector.
Only... 17 members of Amsat-BB visited my "trap-page"!

So, don't worry just about Eu-Amsat.... but you must worry about all
peoples, WorldWide... probably this phenomenon is a "hard-work-result" of
World's leaders, in order to make the peoples much more insensible,
laodicean, cold... in order to do not have personal opinions any longer.

Is very sad that I say dr Al, but probably, the hard work of Wold's leaders has success.
Peoples watching more TV, working much-much more but.... talking less, thinking much less, so the "personal opinion" is almost eliminated.

Just a different point of view.

487. AO-7 News.

Yahoo group: eu-amsat
Date: 2006-04-14 17:48:09 UTC
From: John Alan Hackett.
Topic: 361 Message: 487

OBSERVATIONS FROM NORWAY. (April 2006).

PASSIVE REFLECTORS.

Residing on an Island with a large mountain in front of my beak ... (nose!, to you) ... while operating AO-7 and pointing the array towards America I have no other option than to use knife-edge propagation which works whenever the propagation decides to play ball. After having had some success with this mode I decided to go one step further.

It's a well documented fact that at 145Mhz mountains can be used as passive reflectors so the last surviving LA2QAA braincell decided that "logically" a 432Mhz signal would reflect a lot easier than one at 145Mhz so I decided to put the theory to the test.

On the next AO-7 pass I pointed the array at the *LARGE* mountain here on the Island with 25 degrees of elevation with the satellite at 90 degrees (in azimuth) from the mountain.

Lo' and behold!, there was PH7PCF *BOOMING* in ... but could he hear me?. PH7PCF de LA2QAA QRK k?.
The LA2QAA de PH7PCF "hello John" answered that question.

Dimensions of the LA2QAA passive reflector are 1200m wide x 865m high. All I need to do now is figure out how to elevate my reflector ... and if you think that's an unusual thought picture PH7PCF with his full size Dutch windmill "elevation rotor".

SUN PANELS.

GM1SXX and myself have been investigating the anomolies found on AO-7 since it's return to "this life". These include natural and seasonal propagation anomolies as well as the possibility of being *ZAPPED* by the BMEWS (Ballistic Missile Early Warning System) radars in the northern hemisphere.
(Yes, we were quite B'mused by this).

However, Al has come up with another possibility. He's been using sun panels to power his station for "yonks" (Yonks = Manchester vernacular for "years"). He'd noticed that the power output had been gradually dropping of late.

So ... armed with a few pieces of technical equipment ... (a wet rag and some Fairy Liquid) ... he went to investigate. A quick wipe with the wet rag and full power was restored to the solar power system. Now ... imagine how much spacedust must have collected on the solar panels

of AO-7 in 32 years!. Logically it must! have some effect on AO-7's solar array even when out of eclipse.

To the best of my knowledge model T Ford type windscreen wipers were *NOT* part of the installation on the sun panels.

dr John,

I'm glad for your observation! You are confirmed that I had said several
weeks ago on this reflector, but "someone" .... smiled (ironically?) here.
But afterwords smiles comes the teardrops...Now its cry-time ! (revenge is
eaten always cold! ha ha ha !)

About the reflection's similarity between VHF-UHF my experience is that,
sometimes
is similar, but some other times they have absolutely different behavior
these two bands.

I can't say 100% sure, but I have noticed that the dampness WX (not rain)
helps the mountain's reflection on VHF-UHF high enough. Of course, I'm sure
you have there always dampness in contrast with Athens, where the WX is
usually dry.

About elevation, I believe that depend on the mountain's surface, you need
some tests
in order to find the best "angle". Here the mountain that I use has a
surface (mountainside)
with about 45? declination. So, by aiming my antenna direct to mountain with

10-15? elevation is possible to "hit" the satellite from antipode AOS up to overhead pass, without
any movement of my rotators. But, the mountain here is a few Km wide, not like yours (1200m
that you wrote, is it correct?).

Have a nice weekend all.

Mak,
You're absolutely right!, I missed a zero off the "width" of the
mountain hi, it should have been 12000 meters (makes a big difference).

Part of the rock face of the mountain is inclined at about 65 degrees and
it's covered with a thick sheet of ice at this time of the year so is just
like a mirror.

A lot depends on the type of rock of course, (I should have mentioned this
in the original article).
Granite (hard rock) is a "reasonable" reflector whereas chalk (porous)
functions more as an attenuator! at UHF/Microwave.

However, I imagine you have a lot more experience than I do of these
phenomena, still, it was my first AO-7 QSO using a "passive reflector".

Subject: AO-7 News.

OBSERVATIONS FROM NORWAY. (April 2006).

PASSIVE REFLECTORS.

Residing on an Island with a large mountain in front of my beak ...
(nose!, to you) ... while operating AO-7 and pointing the array
towards America I have no other option than to use knife-edge
propagation which works whenever the propagation decides to play ball.
After having had some success with this mode I decided to go one step
further.

It's a well documented fact that at 145Mhz mountains can be used as
passive reflectors so the last surviving LA2QAA braincell decided that
"logically" a 432Mhz signal would reflect a lot easier than one at
145Mhz so I decided to put the theory to the test.

On the next AO-7 pass I pointed the array at the *LARGE* mountain here
on the Island with 25 degrees of elevation with the satellite at 90
degrees (in azimuth) from the mountain.

Lo' and behold!, there was PH7PCF *BOOMING* in ... but could he hear
me?. PH7PCF de LA2QAA QRK k?.

The LA2QAA de PH7PCF "hello John" answered that question.

Dimensions of the LA2QAA passive reflector are 1200m wide x 865m high. All I need to do now is figure out how to elevate my reflector ... and if you think that's an unusual thought picture PH7PCF with his full size Dutch windmill "elevation rotor".

SUN PANELS.

GM1SXX and myself have been investigating the anomolies found on AO-7 since it's return to "this life". These include natural and seasonal propagation anomolies as well as the possibility of being *ZAPPED* by the BMEWS (Ballistic Missile Early Warning System) radars in the northern hemisphere.
(Yes, we were quite B'mused by this).

However, Al has come up with another possibility. He's been using sun panels to power his station for "yonks" (Yonks = Manchester vernacular for "years"). He'd noticed that the power output had been gradually dropping of late.

So ... armed with a few pieces of technical equipment ... (a wet rag and some Fairy Liquid) ... he went to investigate. A quick wipe with the wet rag and full power was restored to the solar power system. Now ... imagine how much spacedust must have collected on the solar panels of AO-7 in 32 years!. Logically it must! have some effect on AO-7's solar array even when out of eclipse.

To the best of my knowledge model T Ford type windscreen wipers were *NOT* part of the installation on the sun panels.

73 John.

dr John,

I'm glad for your observation! You are confirmed that I had said several weeks ago on this reflector, but "someone" .... smiled (ironically?) here. But afterwords smiles comes the teardrops...Now its cry-time ! (revenge is eaten always cold! ha ha ha !)

About the reflection's similarity between VHF-UHF my experience is that, sometimes
is similar, but some other times they have absolutely different behavior these two bands.

I can't say 100% sure, but I have noticed that the dampness WX (not rain) helps the mountain's reflection on VHF-UHF high enough. Of course, I'm sure you have there always dampness in contrast with Athens, where the WX is usually dry.

About elevation, I believe that depend on the mountain's surface, you need some tests
in order to find the best "angle". Here the mountain that I use has a surface (mountainside)
with about 45? declination. So, by aiming my antenna direct to mountain with 10-15? elevation is possible to "hit" the satellite from antipode AOS up to overhead pass, without
any movement of my rotators. But, the mountain here is a few Km wide, not like yours (1200m
that you wrote, is it correct?).

Have a nice weekend all.

Mak,
You're absolutely right!, I missed a zero off the "width" of the
mountain hi, it should have been 12000 meters (makes a big difference).

Part of the rock face of the mountain is inclined at about 65 degrees and
it's covered with a thick sheet of ice at this time of the year so is just
like a mirror.

A lot depends on the type of rock of course, (I should have mentioned this
in the original article).
Granite (hard rock) is a "reasonable" reflector whereas chalk (porous)
functions more as an attenuator! at UHF/Microwave.

However, I imagine you have a lot more experience than I do of these
phenomena, still, it was my first AO-7 QSO using a "passive reflector".

495. AO-7 report.

Yahoo group: eu-amsat
Date: 2006-04-25 09:21:41 UTC
From: john hackett
Topic: 495 Message: 495

This morning on AO-7's orbit 43882 neither the mode-B nor the mode-A transponder was switched on though the mode-B transponder was operational on the previous 43881 orbit.

Yesterday (24.04.06) the the satellite switched from mode-B to mode-A at 0859 UTC but back to mode-B again sometime prior to 13:00 UTC (orbit 43883).

This suggests the timer is operating again BUT BE AWARE THAT THE SELECTED MODE APPEARS TO BE QUITE RANDOM.

Hi Thomas,

Thanks for the posting and the information.

The originator of the message has been deleted from the group membership and tracked down.
The AMSAT-EU Group is a forum for amateur radio satellite users and enthusiasts.
I did remind him that spamming is an illegal activity (in many countries at least).
The originator has nothing to do with UNHCR except the for sharing the name but with a biz suffix on the URL.

Kind Regards,
Al GM1SXX

John, Al & Group,

This Group does not accept as members persons without "callsign". That was our primal policy.

However, I think is good to be open in peoples which they have interests about Amateur Satellites (ie SWLs, Electronic Engineers, students), but in this case is not enough an Email like xxxx@... or xxxx@...
which sometimes is "fake", without original personal elements.

So, if somebody wants to be a member without callsing, I believe that we should give the opportunity in someone which is interested for our hobby, if we have some guarantees for his personal elements (like a confirmed personal-phonecall or a true Email-address from a real ISP etc).

EU-AMSAT Group is not a mystical place, definitely.

But on the other hand I don't like to have any involve with policy, promotion, propaganda, racism, religion or any other kind idea's distribution which is far-away from Ham-radio (like the last posted messages).

In this case I will ERASE immediately the member (and his messages).

From: AD5VJ Bob
Topic: 503 Message: 503

Hello everyone:

I am new to the list and new to SAT WORK.

Thanks for having this list, I have a million and one questions and will be listening allot.

First one is, I was just using my Kenwood TS-2000 and my new dual band antenna to set up Ham Radio Deluxe for VO-52.

Everything seemed to be ok until I actually got it set up on CW mode and then all of a sudden I heard what I though was extremely
slow drawn out CW.

I am not experienced at all at this but don't see how that could have been VO-52 when it was over EU at the time and I am at EM-12ds
(North Texas). So I guess my first question would be do the birds, as I have learned they are called, share frequencies with one
another?

73 fer nw,
Bob AD5VJ(AAR6VM)

From: John Alan Hackett.
Topic: 505 Message: 505

For those wondering what the occasional wierd CW sounds in the satellite passband are lately I can assure you it is *not* LA2QAA transmitting in Russian, it's a demented AO-7 beacon spitting out harmonics.

This occurs when the switching system gets it's knickers in a twist. (read: trying to switch between modes A, B and C) due to frequent eclipse periods.

As is (or should be) well known, AO-7 can only operate when it gets enough sunlight and the mode is completely random.

For the above reason please observe QRP operating proceedure.

Does it sound like verrry slow drawn out code? If so then I have heard it just the other night when AO-52 was over EU.

I was tuned in for AO-52 and heard that in the speakers, as I went to the rig and looked at the plot that HRD had was generating, I
couldn't believe it was AO-52 because of it's location.

So maybe it was what you are talking about?

73 fer nw,

507. RE: [eu-amsat] AO-7's beacon.

Yahoo group: eu-amsat
Date: 2006-05-11 16:49:46 UTC
From: Emily Clarke
Topic: 505 Message: 507

There is speculation that the long-drawn out code beacon is the
codestore system. The memory is probably toast, so if the codestore
system turns on it would send out whatever is in memory, and the
levels are probably just a random number of ones and zeros.

73,

Emily

508. Re: [eu-amsat] VO-52???

Yahoo group: eu-amsat
Date: 2006-05-11 17:08:48 UTC
From: SV1BSX
Topic: 503 Message: 508

Hi Bob and welcome to the "Club",

QSOs through Satellites need some knowledge about these birds
(bird=satellite).
It is not enough just a "tuning" of your radio onto VO-52 frequency.

First, it's necessary to learn how the satellites are moving around Earth
planet. As Nader
wrote you before, you need a program in order to have the
necessary
prediction about satellite's orbit.

Unfortunately for you (and .... Europeans!) it is not possible to
speak from Texas
to Europe by using the VO-52, because this bird is very
close to Earth (about 650 Km),
so the footprint of it onto Earth surface is very small.

Nowadays we have just a few LEO satellites in use, like VO-52, FO-29 & AO-7
for SSB operation, so at the present time
is difficult the overseas QSOs. Occasionally, if a bird is above Atlantic
ocean, only then
is possible a QSO between Canada - US Eastern States and Western Europe,
nothing more.
But, you have the opportunity to speak with all US-states, South America,
Canada etc.

The next year we will have in orbit the new HEO satellite P3Express. Via
this satellite we might speak, without the
limitation of LEO sats.

Hope that helps you for now. If you have any additional questions, pse let
me know.

From: AD5VJ Bob
Topic: 503 Message: 510

This is wonderful information. Thank you so much for this and I will take it all to heart.

I am hoping to learn as much as possible about the birds, now that it is finally an option for me with my new TS-2000 radio.

It is really a lot of fun already just watching the Ham Radio Deluxe program plot them and watch them go around as they do.

The numbers are meaning a little more to me now and I am slowly figuring out how to use them to better assist me in when I have an
opportunity to work one.

I am curious, however, about the modes and which ones are easier to work than others.

I have only 100W output and a 5/8 wave vertical at this point and of course want to maximize my opportunities to work something.

Is any mode or bird any easier than any other that maybe I should target right now?

511. Re: [eu-amsat] VO-52???

Yahoo group: eu-amsat
Date: 2006-05-12 00:02:24 UTC
From: SV1BSX
Topic: 503 Message: 511

Bob,

I'm an "old-fashion" Sat-operator, so I can't help you about modern methods
& equipments
on Satellites, like HRD (Ham Radio Deluxe) program and TS-2000.

>I am hoping to learn as much as possible about the birds,
>now that it is finally an option for
>me with my new TS-2000 radio.
>
>I am curious, however, about the modes and
>which ones are easier to work than others.

The usual Sat-modes on current satellites are "Mode-B" & "Mode-J".
"Mode-B" means your transmission (Uplink) is on UHF and
your receiving (DownLink) on VHF.
The "Mode-J" is just the opposite.

>I have only 100W output and a 5/8 wave vertical
>at this point and of course want to maximize
>my opportunities to work something.

It's quite difficult to work Satellites by using this simple antenna on both
Bands.

>Is any mode or bird any easier than any other
>that maybe I should target right now?

Even I don't like too much the FM-birds, however for your begining I will
suggest
you the AO-51. This week working with HI-power on Downlink, so you have
a great opportunity to listen it strong enough with your simple antenna.

AO-51 is an FM LEO-Satellite. That means the bird can be used
only by one user on uplink which speaks with some other user on downlink,
in other words it works like a repeater on the sky.

Firstly, look at in the prediction program for the next orbit of AO-51 over
(or near)
to your location. When the satellite is "in range", look for a carrier
around
435.300 MHZ (FM Narrow). When the Satellite rising (AOS = Acquisition Of
Signal) & comes to you, the frequency is
slighty higher begining from 435.310 (+10 KHZ maximum, due to Doppler
effect).

When the satellite is approaching to you, the frequency decreasing and is equal
to Satellite's normal frequency (=435.300) EXACTLY the moment which is known as
TCA (Time Closest Approach).
After this time, the satellite will draw away from your location, so now the frequency will
decreasing (435.299, 435.298 upto -10 KHZ from 435.300) till the LOS (Loss Of Signal).
That is very important to keep in your mind, in order to "follow" the drift of satellite's frequency due to Doppler effect.

So dr Bob, just let's try it... if you can hear it good enough the Downlink of AO-51,
may be is possible to transmit in order to have a QSO through this bird.

But firstly, just try to listen the bird. That is very important.
Only if you can listen the bird clear enough, you can try to
speak through the bird. NEVER the opposite.

In other words, DON'T SHOOT the bird if you CAN NOT HEAR the bird's flit !
That's the "1st law" of a good "hunter" !

73, Mak SV1BSX

PS: John LA2QAA & Al GM1SXX, they have written a good handbook for
Satellite's rookies named "Satellites for Dogs". May be is usefull to read
it. Ask John & Al for more details.

>

Well, lets consider for a moment some of the other systems aboard AO7
before we dismiss the Codestore memory as 'toast'.

The Telemetry system works when fed adequate power. At least, it did
the last time I copied data from it. When it was sending data blocks
ending in 649,650 or 651, the data made sense and data from the
previously known good channels was fairly nominal when decoded.
This fact in itelf was a great surprise to both LA2QAA and myself.
Apart from the U/S battery, the bird appeared to be fairly healthy.
Of course the TLM system does not measure every parameter but what
data we could collect was meaningful.

Please bear in mind that a very few channels were already suspect at
launch time. I took that fact into account when assessing the
telemetry data and disregarded the few known bad channels.

The mode switching timer works. This was studied by LA2QAA recently
in some detail while the bird was in full solar illumination. The
timing was not as exact as we expected but Jan and Karl used an R/C
timer and not a crystal one as some of us thought. This point was
clarified to me by Jan himself. Validation of measured data is a
good way to prove things. The timer did not behave exactly as we
expected. Now we KNOW why. Jan's explanation fits the measured data.

Now for CODESTORE.
CODESTORE is built of discrete components, not off the shelf memory
chips as with most other birds. Please remember that AO7 is a very
old bird built at a time when many comuters used mag-core memories.
Most memory chips are built of gates and flip-flops integrated on a
single chip. AO7's memory was not of this type but was built from
many individual IC's.

So, is CODESTORE toast?

Well, since the CODESTORE is *not* constructed using modern (fragile) DRAM chips, why would we expect it to fail any more than say the telemetry system or mode switching timers which obviously do work?

Electrical power is the limiting factor in Oscar7. Without adequate power to run the onboard systems, it is not possible to test Emily's theory that the memory is toast.
On a few occasions, AO7 has had enough power to do some meaningful experiments such as those studies made of the mode switching timer made by LA2QAA or to decode telemetry when the system was sending telemetry that made sense on most of the channels that were proviously known to be working.

I do agree that Codestore probably transmits rubbish when it sends anything but that in itself does not indicate failure of the chips. The memory is volatile so loss of power means loss of contents and loss of power is something that happens routinely with AO7.

It's easy to jump to conclusions but much more difficult to make a meaningful assessment of the true situation. For that you need facts.

On a personal level, I might believe CODESTORE is faulty when someone provides the proof. The first generation CMOS chips have proven to be very tough indeed when applied in space applications.
AO7 is good proof of that.

From: Allan Copland
Topic: 505 Message: 513

Hi folks.

For anyone interested in the Codestore system on AMSAT Oscar 7,
I can confirm that it is indeed built from individual CMOS parts
from the very early CD40XX-AD series of chips. (Data source.. Jan King)

While these chips may not be quite as radiation tolerant as the CMOS
used in some other parts of the spacecraft, They will be more robust
than the chips used in more recent craft.

Jan Reckons that CODESTORE has a meagre 180 bits of memory onboard
and the system was constructed from a stack of individual PCB's
carrying discrete IC's making up the memory... basically shift registers.

If CODESTORE is indeed sending 'rubbish' it would be a worthwhile
experiment to try to access it while the bird is in good illumination.

Far from being 'toast', this could be an excellent experiment for
those with good CW skills. The chance of success will depend on the
power available to run CODESTORE and the state of the system itself.

Since AO7 has no batteries, there is no scope to cause problems with
the bird when attempting such an experiment.

Remember that CODESTORE will start up on each illuminated pass with
nothing meaningful in the buffer. Thats to be expected. (Read
gibberish).

If it could be proved that CODESTORE does actually function (as does
much of the remainder of the craft undergood conditions), it would be
very useful information indeed.

Innovate....don't speculate!

515. A-O-7 A request for assistance.

Yahoo group: eu-amsat
Date: 2006-05-15 15:00:24 UTC
From: Allan Copland
Topic: 515 Message: 515

Hi Folks,

I don't do this sort of thing very often but I need your help!

If anyone has the means to record the downlink beacon of Oscar7 I'd be exceedingdly grateful for recorded copy of the gibberish that it sends. I need this recording for a project I'm undertaking.

If you record the gibberish from your radio direct to your PC's soundcard as a WAV file and send it to me as an email attachment I'd *very* grateful indeed.

Small snippets are OK but it would be immensely useful to me if a longer sample could be collected, perhaps half of a pass if you are not desperate to transpond through the bird on that particular pass.

Small snippets are acceptable though. Every little helps!

If I can deduce anything useful from said 'gibberish' I'd be happy to give you a 'mention in dispatches'.

I can be reached at allan_gm1sxx@...

Kind Regards & 73,
Allan Copland

Hi Allan and forum

I listen every weekend to AO-7 if it is sunlit on 145.972 MHz (+-).
Listening on 10m is not possible while QRM. But I hear the "gibberish"
very rare. My antenna is a X-yagi with fix RHCP. Is this the correct
polarisation or sends AO-7 with LHCP like UO-11 ?

517. AO-7 Polarisation.

Yahoo group: eu-amsat
Date: 2006-05-15 18:39:07 UTC
From: john hackett
Topic: 515 Message: 517

Gentlemen,

Here's the polarisation for AO-7 for the northern hemisphere.

2m/10m uplink = LHCP.
2m/10m downlink = Linear.
70cm/2m uplink = RHCP.
70cm/2m downlink = RHCP.

435.1Mhz beacon = LHCP.
2304.1Mhz beacon = RHCP. (This aerial is shielded from the earth in the southern hemisphere).

Naturally, the polarisation sense will be opposite for the southern hemisphere. with the exception of the 2m/10m downlink which will of course still be linear.

73 John. <la2qaa@...>

518. AO-51 over Europe

Yahoo group: eu-amsat
Date: 2006-05-15 19:55:58 UTC
From: SV1BSX
Topic: 518 Message: 518

Hello all,

during the last days, AO-51 is accessible very difficult over Europe. I don't know if that is a random event, but I think it happens after '"switching" in Hi-Power FM-Mode. For example, it was possible to have access on the bird by using 10-20 Watts (usually). The last days that is impossible even with... 100 Watts on Uplink! And I'm talking for RIG's output power, not about ERP!

I wonder if during the last Hi-Power FM-Mode's switching took place any other change, for example in sensitivity of bird's receiver and thus, it is much more assailable on QRM from "non Satellite ground stations". It's really very sad, but under this condition this bird is almost "unusable" over Europe. The worst is that, several QSOs remain usually uncompleted, as it's not possible to exchange with the other-side operator a second MIC (for the report & QRA or the final "QSL-73").

That is not just my personal opinion... yesterday evening I had a conversation on a popular "European Satellite chat-room" with several Europeans satelliters about that and definitely, this event is confirmed by all operators.

Before any anwer on my Email, just think the following:

if the problem is presented on AO-51 over Europe due to heavy QRM, why the SO-50 is not effected during the similar orbits? Also the AO-27 is easily accessible (when is "ON") even without... subtone on Uplink . Just a few thoughts.

73, Mak SV1BSX

I am interested in collecting recordings of the audio on the VHF beacon downlink on 145.972Mhz in order that I can do some experiments with it. Short recordings would be acceptable but longer ones lasting perhaps several minutes would allow me to do a more meaningful experiment.

I live in a large town with considerable interference in the 2M band. If you could record some audio as a wav file it would be of some use to me. Even if the gibberish is weak and watery it is still of interest to me for signal analysis.

**Mineo Wakita, JE9PEL, made such recordings. Look at his website
http://www.ne.jp/asahi/hamradio/je9pel/ao7cwtlm.htm . Hope this helps.
My mystery is, that I can hear the 2m beacon very rare.

Hi Thomas.
No detailed information seems to have been published. perhaps you should contact SSTL directly and ask.
The best reference I've found for you is at
http://aria.seas.wustl.edu/SSC01/papers/6-7.pdf
Even that is not detailed but it does confirm the frequency bands used although not the actual frequencies.

The best advice I can give is to contact SSTL. Enmail should be quickest.

Kind Regards,
Al.

Hi Thomas.

Perhaps it would still be a good idea to confirm with UoS that the bird is still transmitting on that frequency before spending too much time, effort and and money
The AMSAT page is about six years old. Things may have changed since then.

SNAP-1 is a tiny satellite. I saw an engineering model of it at the UoS. Best of luch with your efforts.

Hi Allan

It was just a quick idea to listen for it with my SSB SAT-2000 converter,
which is a broadband type, developed for Arsene-OSCAR-24. But 100mW are
to less.

I miss the S-birdies ;-)

Well Thomas, it may still be possible at 100mw if you use some clever
software like Fast Fourier Transform to pull the signals out of the
noise. Could be a good technical challenge if the bird is still TX'ing.

I guess you could chose the centre of the expected passband and just
look for the dopper shift on any signal present. The dopper at 2.4G;s
in LEO will be substantial.

529. Polarisation box

Yahoo group: eu-amsat
Date: 2006-07-11 20:51:43 UTC
From: Thomas Frey
Topic: 529 Message: 529

Hello All

I have trouble with one of two phasing cables to my 2m JBeam 5-ele. X-Yagi. From a fleamarket I have a JBeam polarisation box. Now I think about a rewireing of my antenna with inclusion of this polarisation box. The yagi is mounted inhouse, the weather is no problem. The box will be located at the mast, not in the shack, to prevent cable loss and to mount the preamp near the antenna after the box in direction to the shack.

Now my question: Is it possible to switch the box remote-controlled ? Eventually with a step motor or something else ? Otherwise I have to run to the antenna between the QSOs :-) Have you any ideas ?

Regards, 73

Hi Thomas,

always is possible to control any switch from some distance, but for more ideas
we need to know how is constructed your polarity-box. We have not a picture....

Step-motors are good and strong enough, but they need some circuit in order to drive the motor. That is not very easy, sometimes. I prefer the common DC-motors which are very simple-machines in the voltage feeding, they don't need
electronic circuit and just by reversing the DC polarity, easily moving CW or CCW. However they need a mechanical gear, in order to be able to move a rotary-switch because the torque of DC-motors is not very high.

The usual problem with similar units is the "stop" technique of motor. In other words, the motor needs a good system in order to stop the switch at the
right place, not between the contactors but onto the correct contact in every
circle. This problem sometimes is easy, some other times very complex and depending upon the skill of constructor, the switch, the motor etc.

Give us some details about your polarization-box (or a picture). Is it with a
rotary switch or something else?

But in any case, I will tell you that: the most polarization-systems usually are
constructed with "coaxial relays". By using these is very easy to control your antenna polarity from your Shack with very good accuracy.

4 relays are enough to change the polarity on a pair of X-yagis between RHCP, LHCP, HOR & Vertical.

73, Mak SV1BSX

Yes, its a rotary switch with an axis of 6 mm and knob and cables with the specific
length inside a platic box. The connectors are SO-239 types. The box was developed
from JBeam and/or UKW-Berichte Terry Bittan many many years ago.

Thomas,

few months ago I found on Internet a simple and cheap circuit for
step-motors driving. It was based on a PIC controller. Of course,
the PIC ICs are simple enough, if you have some experience with
these components, don't forget, in practice it's a small programmable
micro-controller.
If you have not experience, they are not very simple constructions, as they
need
programming by using a programmer circuit (the HEX file is "free" for the
"Step-motor" driver).

If you know what I mean and this circuit is usefull to you,
I will find the URL.

> This will give me an idea to turn the rotary-switch. But it must be an
easy
> mechanical solution.
>
A very easy mechanical-gear is possible to be made, by using a wheel into
your switch's axis
(like these which used In old-radio's variable-capacitors) .
You need also a smaller wheel into motor axis. Thus, if the motor wheel is 1
cm diameter and the wheel on the switch-axis is
10 cm diameter(or larger), the torque of motor increasing spectacular and is
possible to turn
the axis (rotor) of switch. The coupling between these 2 wheels is possible
to be made by using
a string (fishing-line, cord etc).
Another point is the spur of switch. Normally, this spur is strong enough
in order to
"lock" strongly enough the rotor (axis) of switch in the right place,
exactly onto conductors, each time when the switch is rotated between
the "positions". If the mechanical gear is not possible to turn the rotor of
switch (due to

small torque of motor), a good combination is to remit (abate) the power of spur, in order to be able to move the
rotor of switch much-much easier.

Another solution is also a small vernier 1:50 or 1:100, for the coupling between rotary-switch
and motor. These verniers are still available in electronic-shops, on eBay etc.

I hope that helps you.

Oh yes, thank you. I will look in the model/mockup-builder scene for
such a solution. I'm not a mechanician, but can work with a
screwdriver ;-)

535. Live Demonstration of Reception of Mars Reconnaissance Orbiter

Yahoo group: eu-amsat
Date: 2006-07-15 09:22:38 UTC
From: Trevor
Topic: 535 Message: 535

Live Demonstration of Reception of Mars Reconnaissance Orbiter

In addition to the presentation by Achim Vollhardt DH2VA on the remarkable achievement by Radio Amateurs in Germany in receiving signals from the Voyager 1 at the AMSAT-UK International Space Colloquium we can now announce that the event will also include a live demonstration of DX reception from deep space.

Freddy de Guchteneire, ON6UG, will be receiving signals live from the NASA Mars Reconnaissance Orbiter. This spacecraft was launched last year and only entered Mars orbit in March 2006. By the end of July Mars will be at a distance of approximately 350 million kilometres from earth so we cannot expect the signals to be very strong!

The demonstration is expected to take place on the Saturday of the Colloquium - the exact time will depend upon scheduling and visibility constraints.

The International Space Colloquium takes place from Friday 28th until Sunday 30th July at the University of Surrey, Guildford, England and all Radio Amateurs and SWL?s are welcome to attend. The AMSAT-UK website has the latest draft programme and online booking form and maps

http://www.uk.amsat.org/Colloquium/

536. Satellite chat-room "closed-down" !

Yahoo group: eu-amsat
Date: 2006-08-27 20:11:34 UTC
From: SV1BSX
Topic: 536 Message: 536

Hello to Group,

the summer is close to finish, so I hope you enjoyed the summer-vacations .
I wish your "body-battery" to be full-of-charge now!

Yesterday, unfortunately I noticed a bad-news:
the ON4KST chat-room "closed-down"!

Probably was without users, so the sysop considered that does not exist
raison d'entre of "Satellite chat-room". This way we havn't an Internet
on-line chat-room any longer. I send message to Alain, ON4KST, to
re-activate the chat-room, but I don't know if that will be possible soon or
later.

If not, I wonder if someone on the group has the capability to create
something
similar. The "chat-room" was very useful tool, we had excellent
conversations on it
about sched's, technical themes, observations, experiences about Satellites
and (personally)
it will miss to me. Especially during winter's cold-nights was a good
companion in
order
to be able to talk with several good Satellite-friends from Europe and
rest World.

That's the news. CU on Sats (BTW I'm still without antennas due to
re-building of
my house's roof, but I believe to put back on my roof during September... I
hope!).

Hi Mak

Has Alain, ON4KST, ever made a posting in this group about his
chatroom ?

Hello guys,

There is a chat room available on IRC which is used for the Houston AMSAT Net on Wednesdays at 0100 Z. However it is not used very heavily the rest of the week. There is an article about how to use it in the Jan/Feb 2006 AMSAT Journal.

I have the Chatzilla extension installed in my Firefox browser and I issue the following commands to connect to it.

/server irc.dishnuts.net
/join #amsat

There are usually a few people connected to this chat room.

540. NEW Satellite chat-room

Yahoo group: eu-amsat
Date: 2006-08-31 03:30:54 UTC
From: SV1BSX
Topic: 540 Message: 540

Hello to Group,

after the final but unreasonable (at my opinion) "closed-down" of ON4KST Sat-chatroom,
the last days I was looking for something new.

Well, the Amateur radio community has in use an immiscible "converse-mode", almost without users from the good old days of packet radio.

I made several tests yesterday and it seems to work well. At the present time I found
just 2 Gates from SV-land for access, but may be they exist several others in use WW.

In order to access this CONVerse, visit:

http://www.qsl.net/sv1bsx/sat/satchat.html

On this page you need to type your callsign and the "channel". Now the default channel
it's the 154, but that belongs to Greek chat-room, so please type a newnumber as entry-channel: 29450
(I choose this number from downlink of AO-7 in mode A, but if you have any better idea is
welcome, the available channels are between 2-32767.)

Next step is to push the "LOGIN" button.

After few seconds, it will appear on your screen a chat-mode frame. Unfortunately it is
not very pretty, like ON4KST's frame, but it works !

The strange is that, if you type a message into message-field and then you press ENTER,
the PROMPT disappeared! So, if you want to type your next message, you must to press the
TAB (or to make a "click" with your Mouse into "message-field".).

Keep in mind, if nobody is there, the channel is "close". When the first user makes LOGIN, the
channel will "open" again but, it has lost the "topic" etc. from the previous usage. So it is good
to stay online as much time is possible, every user which has broadband Internet connection.
(I will try to keep the channel alive the next days).

This CONV is accessible also via Radio-Packet network, so if you have a Local packet network

in your area, even at 1200 Bps, you can do it. (I'm using my Packet-radio
9600 for that).

Finally, after your first connection read the HELP of CONVerse. Including
several
interesting commands, like "private chat" between users, /ni [your_name] for
"nickname etc.

I hope you enjoy it.

545. AO-7.

Yahoo group: eu-amsat
Date: 2006-10-02 17:41:42 UTC
From: john hackett
Topic: 372 Message: 545

Hello folks,
Interesting to see W7JPI's AO-7 log entry on orbit 45879
where this station claimed to have worked KB2M, K4TB, WB6YTE and WA4III at
16:35 GMT yesterday (01-10-06).

This is particularly interesting because The USA wasn't even in the passband
at that time, the satellite was in fact over Polynesia.

Of course, there are a couple of possibilities, the station concerned might
have entered the wrong data ... or it just might just be someone playing
around.

What is interesting is in fact the amount of stations logged on or worked
yesterday ... confirming that quite a few new stations are appearing on
AO-7.

This is good.

73 John. <la2qaa@...>

546. ... Err!, an observation.

Topic: 546 Message: 546

Hello Folks,
As we all know (or assumed), AO-7's battery system has been down the tube for a couple of decades. However, this morning I got quite a surprise.

I always monitor the old girl before actually *bellowing* into the microphone. As is my want, I was watching both InstantTRACK and NOVA on seperate computers (and before you comment, my keps are! correct and up to date). The satellite came up over Northern Russia at 09:58 UTC on the 45926 orbit and was in complete darkness at that time but just for a laugh I sent a few CQ's on CW (432.150 up 145.941 down) and to my surprise I copied LA2QAA calling CQ - (that's me folks).

Thinks ... "This can't be, the batteries are knackered".

This instigated careful checks of time (Atomtime Pro), keps & doppler - no doubt - (both InstantTRACK and Nova agreed) - AO-7 was in darkness but I was able to copy my downlink at S3. A few minutes later, when the old girl came into sunlight my signal shot up to S8.

Careful checks of my hearing and senility confirmed that both are! functioning correctly.

So ... how come I could hear myself when AO-7 was in darkness?. As can be imagined, I will keep tabs on this tomorrow morning.

Sensible explanations please written on the back of a clean $100 bill wrapped round a wallbrick and chucked through my window - or - an e-mail to <la2qaa@...> at a pinch, will suffice

73 John.

Hi John,

I would like to check again this... on my PC + Nova today morning at 09:58
UTC the
AO-7 was in Sunlight and not in eclipse, but yes, it was over N.Russia.
Also I noticed that, during the same time the orbit is #45920 and not
#45926
as you mentioned.

I wondering.... my "data" is updated with 29/9/2006 2Line Keps-file, my
clock
is OK and I noticed that the AO-7 was on eclipse till 09:38 UTC (orbit
#45919).
At 09:39 UTC was in Sunlight till 11:22 UTC and the starting point of #45920
orbit
was at 09:45 Z.

I checked also that with another Computer and the results are identical.

Sorry for asking but, are you 100% sure about your correct data ? Please
check it again and let me know.

Hi all,

good one Luck, probably here is the John's trap!. However I wonder dr John,
why are you looking for AO-7 activity vis-a-vis to Gray-line on the Earth?

NOVA has into Satellite-tables the "Visual" option. That says clear enough
if the
Satellite is illuminate or not, independently of day light or darkness onto
planet's surface.

My attach picture shows that. As you can see, AO-7 seems to be in darkness,
but
the Visual-option has a different opinion: SUN !

That means the Satellite is not in eclipse, so it's "ON".

Hello Suli and tks for reply,

My antennas is about 3 m above rotator, so it is not possible to
increasing the distance, but thanks for your suggestion.

Actually I changed the cables arrangement (I had common GND through RG-8)
and now the noise reduced about 70%. The additional filter with VK200
and 0.1 caps (and the winding of cable trough PC-ferrites) did not help.

Now the noise is 1-3 S, it is not perfect but much better than before. I
believe
a cable with grounded outer-shield like RG-cables it will eliminate this
noise.

Suli, I'm looking for Nader. I need the ST-prefix but no lucky the last 2
days.
Is it possible any schedule with him? I'm QRV this week on daylight and
afternoon
passes (FO-29, AO-7, VO-52 mainly, but I can also via AO-51 if the QRM
allows
the contact !)

559. CONVerse (chat-mode) Update

Yahoo group: eu-amsat
Date: 2006-10-18 22:30:32 UTC
From: SV1BSX
Topic: 559 Message: 559

Hello folks,

last tests via Internet connectionn with CONVerse-mode they had problems with HTTP browsers like Internet Explorer, FireFox etc (either on JAVA or PHP), but finally we have found the solution:

This CONVerse server is easily accessible via the Internet connection by using an advanced telnet application, called TTY-Link written by PA3AZK (many thanks to SV1UY for info).

You can download a copy of it from our Yahoo Group (visit http://groups.yahoo.com/group/eu-amsat/files/Converse/). After Download extract the ZIP file (ttylink.zip) by using the PZ-Unzip program (or similar) and install TTY-Link in your Computer (with "setup.exe").

It is a nice clean program, and to connect to the world wide CONVerse all you have to do is to RUN this after your Internet dial-up or broadband connection. By "click-ing" the SESSION (left up), a small new window will open on your screen with HOST & PORT fields.

Type on HOST: www.hb9ok.org
Type on Port: 3600
(default port is 87)

Press OK.

A connection with CONVerse will appears on your screen as follow:

*Convers @ Lugano_CH HB9OK
*
*Enter with:
*/n <callsign> [<channel>]

Type for login:

/n <yourcallsign> 29450

press ENTER

That's all !

Yesterday evening we tested that with excellent results. Aldert, PH7PCF and me we had a lovely chating for about 3 hours, without problems. It's fast,easy & accurate without errors and finally we have our own independent chat-room.

Enjoy it !

73, Mak SV1BSX

562. ST2NH update

Yahoo group: eu-amsat
Date: 2006-10-23 15:30:29 UTC
From: SV1BSX
Topic: 562 Message: 562

Hello folks,

just a few mins before I heard Nader, ST2NH in QSO with Dom, I8CVS. Nader said to Dom that, he worked 22 European countries with a total of 100 QSOs, including AO-7, FO-29 & AO-51 Satellites.

He also informed us about 2 other callsigns which we have heard during last days, ST2M & ST2ZSS (ST2ZSS during JOTA). They are both active from Nader's shack.
.
FB Nader! Congratulations and thank you for the "new-one" on Satellites.

73, Mak SV1BSX.

Hi Suli & Group,

yes, may be you have right about ST2 *K* SS callsign, sometimes the accent, the spelling, sometimes is difficult to hear it correctly on Sats. Sorry if I wrote wrong the call.

Today I met again Nader with Dom on FO-29. Unfortunately I received only the end of QSO but I heard some interesting details about Nader equipments. Well, from ST-land he makes use of Icom 901 with 5 El. VHF Homebrew Yagi on horizintal polarization & 12 El. homebrew UHF Yagi in vertical polarization.

Hello Mak and Group

When Nader, ST2NH, will leave his QTH in Kartoum, would his shack be
open for ST2M and/or ST2KSS for further operation ?

hi all
I think DR:nader ST2NH will leave Sudan next Saturday October 28, 2006. He is monitoring Arabian net frequency on 20m band 14.290MHz after satellite pass
I hope he can copy my call
I will call hem and ST2M also. And I will ask hem about the sat activity after hem and who will take assist of it

Hi I met ST2NH last night on Arabian net on 20m band I asked him
about the activity in Sudan after him
he say no one have SSB \VHF radio they Have only FM and no antenna
also
He will take his station back with him to Saudi Arabia to continue
satellite from there

Hello folks,

between 15-19 November, a Greek radio-amateur team will activate for first
time in history the rock-island FALKONERA (grid locator
KM16WU,

571. Cheap elevation readout - a tip

Yahoo group: eu-amsat
Date: 2006-11-03 18:50:42 UTC
From: OM0AAO Viliam
Topic: 571 Message: 571

Hello,

half year ago I have read about simple but accurate digital elevation readout. I want to obtain one electronic spirit level but in my country it was a hard job.

But now has been selled by Lidl stores for 30 EURO. In combination of sat screw-jack can be completed cheap elevation rotator.

Elevation readout:
http://members.chello.nl/j.swienink1/elevation.html

SV1BSX's antenna elevator:
http://www.qsl.net/sv1bsx/actuator/actuator.html

Hope that someone need this,

Hi Viliam & Group,

very-very interesting link, indeed !!! Thanks for your post, I will add this on my elevator-page as new link, ASAP !

However, the main problem with most of these units is the non-compatibility with auto Tracking-Boxes for automatic antenna position, which they need 0-5 V variable voltage-feedback. They are perfect just for manual tracking but with auto-tracking programs usually have problem, due to digital encoded output.

I will take a look on D1225E-DataSheet PDF later. If the output of D1225 is analogue, then we have no problem... it could work easily with Satellite auto-tracking antenna programs.

73, Mak SV1BSX

Hello Makis,
Something wrong with your copy of VQ-Log...
It's working fine for me for a years!
And GM land, of course, counted as a country via satellite.
You can see that on my home page.

Please, go to: Menu->File->Access the Logbook->Access by
DXCC, or simply press "Ctrl+F7", when VQ-Log is active.
It will open small window, where you can find,
"GM, GS Scotland".
Check that please.

Hi Mak

I don't know this software. But it looks like GM is not in a database.
A restart of the program or reboot of the PC will not help in such
situations. Look also at http://www.vhfdx.net/vqlog.php

Hello All and a very prosperous New Year

We all wish to have P3E in orbit this new year. But I think, this will not occur. The earliest possible ride would be at the end of this year with an Ariane. The second possibility is a ride on a new Soyuz from the new russian launchplace in Kourou. Because this launch would be much less cost intensive, I think, the earliest launch of Phase-3E will be at the end of 2008.

585. AO-7 status

Yahoo group: eu-amsat
Date: 2007-01-02 16:25:14 UTC
From: SV1BSX
Topic: 585 Message: 585

Hello folks,

I observed that AO-7 is again "out of eclipse" till April 2007.
The current year we have a period of about 3.5 months where
the Satellite is continually under Sun light,
so here we have a good question:

What time exactly the internal timer changes the Mode between B & A?

During 2006, John LA2QAA had determined precisely the time of Mode-change.

As I read now on excellent AO-7's Logbook of Emily, W1DID, during last days
the Satellite seems
to change Mode between 11-12.30 UTC.
So, it's highly appreciate more observation around this time in order to
determine
the change-time with much more accuracy.

..hello Thomas and Happy New Year.

Yes, your scenario is 100% realistic.... unfortunately....
always the launch of our HEO Satellites
was a terrible story, with big delays.
I believe that 1-2 more years it's too much time
without a HEO if we want "fresh blood" in Amateur Radio.

BTW a good friend of mine on top of P3-Express project, he
told me ("of the record" !) that the Amsat-DL is in a strange
"relaxing" with preparation of P3-E and this sounds to me very
unusual.
All parts of satellite they have delivered to Amsat-DL but,
.... nobody says anything about flow-chart of project, launch time
(or needed donations etc).
The last update was precisely a year ago (Jan '06) through Amsat-BB by
Peter Guelzow, DB2OS, and after that... nothing !
Completely ..darkness !

On the other hand, the American-friends in Amsat-NA they
are much more active during last period for Eagle Satellite.
They made to deposit 156,000$ till December'06 with a great
campaign through Bulletins, magazines etc. and now they are
very happy peoples in Amsat-NA, as the target was 150,000 $.

However, I hope for a ride of P3-Express at the end of this year
due to excellent relationships between Amsat-DL and ESA.

Who knows... just I hope !

Hello Mak

In the NASA schedules you can also read always "Not earlier than..." ;-)

The "scenario" you can read hear, but in German only:
http://www.amsat-dl.org//index.php?option=com_content&task=view&id=65&Itemid=99

This is the politics of AMSAT-DL. You have to read it as member in whose
journal. But with the new homepage www.amsat-dl.org there is a little bit
of "glas nost".

> The last update was precisely a year ago (Jan '06) through Amsat-BB by

This has also to do with AMSAT-DL's politics. Last year we had a discussion in 'DLs forum about a "thermometer". The answer was "NO NADA !", also a political determination.

I knows, we as members could not understood such decidings. But I think, our president Peter Gülzow makes his job in a way, that we have a new HEO-Sat in orbit as soon as possible.

As said when we are in a state of "Completely ..darkness !" we can only speculate... Is it possible AMSAT-DL put a slow down on their project to give time to AMSAT-NA to let them come closer to the P3E program?

As many AMSAT-NA folks who are actually involved in the P3E project is it also possible with the recent "blackmail" episode they also use the same tactics to force AMSAT-DL to slow down their project? As numerous observer noted it is a cultural trend who seems to also affect the amateur radio field. As busy someone can be it takes only a few lines to summarized the state of construction of a project. Even AMSAT-NA EaglePedia does not reported any changes when asked to list the last 500 changes made on this site...

http://www.amsat.org/amsat-new/eagle/EaglePedia/index.php?limit=500&hidebots=&title=Special%3ARecentchanges&namespace=
(Not too sure if the link will work)

It is strange that on both side there is a curious conjunction of a No New News called it the NNN syndrome as another news problem syndrome called CNN Currently No News. Only AMSAT-NA seems to make fresh news reports. They are adding money on their fund and that they are moving their construction facilities from Orlando to Maryland.

As i said it is only speculations could be 2007 will bring us fresher news.

I knows of the problem not to be informed. Last year we had a couple
of speculations in our DL-forum. The result was frustration and worse
wiggings.

As a member of AMSAT-DL I would like to inform you all exclusively from
our Journal in a quarterly basis about Phase-3E. But I have to excuse
my English in advance, its not so good as yours. There will be only
short summaries, so you are informed. The title will be "P3E News Qn".
What else ;-)

First in German, then in English

Ein Software definierter Transponder fuer P3E

Im Dezember 2005 fand in Marburg ein zweitaegiges Kick-Off-Meeting zu Entwicklung und Bau eines SDR-Transponders statt. Mit dem SDX wuerde die AMSAT neueste Technologien im P3E realisieren, mit denen sich kuenftige Transponder auf Satelliten wesentlich effizienter betreiben lassen. Im Vorfeld zum SDX-Meeting gab es ein einwoechiges Arbeitsmeeting, in dem sich Karl Meinzer, DJ4ZC, und Bob McGwier, N4HY, ausgiebig mit der Inbetriebnahme der neuen IHU-3 befassten.

A Software defined transponder for P3E

In December 2005 a two-day Kick off Meeting take place in Marburg for Development and building a SDR-transponder. With the SDX would AMSAT realize newest technologies in the P3E, with those future Transponders on satellites substantially more efficiently to operate. In the forefield to the SDX Meeting was an one-week work meeting, in that Karl Meinzer, DJ4ZC, and Bob McGwier, N4HY, was extensively concerned with start-up the new IHU-3.

P3E-Solargenerator - Ready to Fly

Die Solarpanels fuer P3E sind inzwischen fertiggestelt und warten gut verpackt auf den Start mit P3E.

P3E-Solargenerator - Ready to Fly

The solar panels for P3E are got ready in the meantime and wait well packed for the start with P3E.

P3E-Endstufen-Meeting in Marburg

Am 6. Dezember 2005 trafen sich bei der AMSAT-DL in Marburg die Designer des Endstufenmoduls fuer 145 MHz und 2400 MHz mit P3E-Projektmanagement und Projektleitung.

P3E-PA-Meeting in Marburg

On 6 December 2005 the designers of the Output stage module for 145 MHz and 2400 MHz met at AMSAT-DL in Marburg with P3E-Projectmanagement and Direction of the project.

597. AO-7 Distance record?.

Yahoo group: eu-amsat
Date: 2007-01-27 15:31:30 UTC
From: John Alan Hackett.
Topic: 597 Message: 597

Hi All,
Anybody worked further than 5449 km on AO-7?

Verona,Wisconsin,USA to Frei Island, Norway.

If you've worked further on AO-7 please give me a shout.

Also worked Igor UA9CS (Urals) on the same pass so the
coverage for AO-7 is pretty good.

73 John <la2qaa@...>

Hi John & Group,

conglatulations for great QSO. FB!

As I have on my records, the lognest distance QSOs via
AO-7 are:

1)
October 17th, 2004
Calls: PH7AT<->WB4LHD
SMode: unknown
locators: EM55DB <-> JO21WA.
Distance ~7408 km.

2)
Date unknown
Calls: K8DID<->YL2LW
SMode: AO-7/Mode-B
locators: Unknown
Distance ~7316 km.

Sorry my friend John, you are in the 3rd place at the
moment, so the Bronze Medal and not the Gold belongs
to you, Hi hi ! But the AO-7's racing will be
continued... keep on the good work.
(unofficial all, due my personal records.
I'm not 100% sure)

Have a nice weekend

73, Mak SV1BSX

PS: John, I put one's shirt on you for Gold-Medal!

Hi folks,

looking for a reliable & easy to use chat-room for
our Group, I'm testing a new application on my new
page.

Please visit:

http://sv1bsx.50webs.com/satchat.html

You must have on your PC the JAVA applet (only if used
XP O/S), but that usually included on Internet
Explorer and Firefox .
(If not, you must download it.)

Please let me know if you have problems.

BTW this applet needs to have braodband connection,
I believe with DialUp is slow.

Sorry for advertising messages at the moment.
I will register the program later, if that is OK.

73, Mak SV1BSX

Cheap talk?
Check out Yahoo! Messenger's low PC-to-Phone call rates.

I'm sure Pat Gower topped 6000 km in the 1970's but don't know if that was
Oscar 6 or 7.

Anyway who cares, 5499 km is still a great achievement.

605. Re[2]: [eu-amsat] AO-7 Distance record?.

Yahoo group: eu-amsat
Date: 2007-01-29 13:21:45 UTC
From: Gennadi Klevtsov
Topic: 597 Message: 605

Hello Makis and the group,

Good question regarding best ODX via LEO satellite.
My personal best ODX via AO-7 with AJ9K = 7155km.
More detales:
26/08/2006 12:33 AJ9K EN53FA 559/559 CW

The question was so interesting, so I checked my
logbook to find the best ODX via other satellites.
VQ-Log gives this possibility in a few seconds.
It was QSO with ZL2VBV via AO-10. ODX=17084 km.
Detales:
07/07/1998 06:45 ZL2VBV RE79TP 44/53 SSB.

From: SV1BSX
Topic: 606 Message: 606

```
Hello folks,

according to last updates, the "longest distance" QSOs via AO-7 are:

1) GOLD MEDALs
---------------------
Date:17/10/ 2004
Calls: PH7AT<->WB4LHD
SMode: AO-7/ Mode-B
Report/Mode:---
locators: JO21WA<->EM55DB
Distance ~7408 km.

2) SILVER MEDALs
-----------------------
Date: unknown
Calls:PH7PCF<->KO4MA
SMode: AO-7/ Mode-B
RPT/Mode:---
locators: JO22JP <-> EL88PG
Distance ~7385 km.

3) BRONZE MEDALs
------------------------
Date: 08/06/1976
Calls:i8CVS<->VA3AC
Smode:---
RPT/Mode: SSB
locators:JN70ES<->EN96LK
Distance ~7237 km

========================================

4)
Date:26/08/2006 12:33
Calls: ES1RF<->AJ9K
Smode:---
RPT/Mode: 559/559 CW
locators:KO29IF<>EN53FA
Distance ~7155 km

5)
Date: unknown
Calls: YL2LW<-> K8DID
Smode:AO-7/Mode-B
RPT/Mode:---
locators: KO26CW<->EN63SX
```

Distance ~7078 km.

6)
Date: 28/1/2007
Calls: LA2QAA<->AJ9K
Smode: ---
RPT/Mode:---
locators:JP33WB <->EN53FA
Distance ~5469 km

==========

.....to be continued !

73, Mak SV1BSX

ps: please send me your "longest distance QSO" via AO-7,
in order to complete this list.

607. Is. No3: AO-7 Distance record? [UPDATE]

Yahoo group: eu-amsat
Date: 2007-01-31 05:26:43 UTC
From: SV1BSX
Topic: 607 Message: 607

Hello folks,

great competition! FB ! Here I've NEW updates about
the "longest distance" QSOs via AO-7.
Actually, I've a few comments and I need your opinion
in order to realise and make much better this list.
Feel free to send me your comments, ideas, QSOs + QSL cards
to my personal Email (sv1bsx@...).

Now, my first comment is about this idea. I had a draft notice
in my PC with "longest distance QSOs via AO-7". Just before
2-3 days, John LA2QAA wondered in our Sat-Forum (Eu-Amsat),
if his QSO with AJ9K it was (or not) the "longest distance QSO".
That was the begigning for me in order to realise and publish a list,
so John's question it was the "trigger". (good-one John!)

2)ES1RF, Genna, he told me about inaccurate distance in
a contact of list. He was probably right. So I need to
check carefully all entries, that is too difficult.
(Check please carefully your contact, before send it to me).

3)Today I received the Emails of i8CVS, Domenico. He
send me also 2 nice QSL cards for QSOs via AO-6 & 7.
So, as Domenico wrote and suggested in a way, it is
necessary to have the QSL cards in order to confirm the
record-list & QSOs. I agree 100%.
I think nowadays that is very easy job. You can send me your scanned
QSL card through an Email, as Domenico did it.
Thus, the list will be much more accurate and valid.
Very soon I will make a Web-page with this list and QSL
cards. A mere example -under construction this moment- is here:

http://sv1bsx.50webs.com/oscardx/odx.html

4)It will be more informative list, if including additional
infos. I believe some "fields" like the Report, Mode, Smode
are absolutely necessary. May be the Power-OUT as well.
Another suggestion is about a small description of used antennas.

5) Someone asked me if is possible to create a "trophy", or
award. OK, nowadays it is easy to design and make an Award.
But I wondering: this ranking is not stable, we have active
Satellites, so the record-list is impossible to stay unchanged for ever.

Today PH7AT & Wb4LHD are shared the 1st place.
If after 2, 3 months, two other operators achieve a bit
longer-distance QSO than PH7AT & WB4LHD, what must

to do? If I have printed the PH7AT & WB4LHD's Awards for the 1st place,
the next Hams will also have on their Shacks another "1st-place" Award !!?
Right ?

6) I suggest to replace the "longest distance QSO" with "ODX"
(Oscar-DX) abbreviation (tks to ES1RF).

7) I have also suggestions for:
I) A new "WORLD-RECORD ODX" record-list
(definitely via HEO... where are you AO-40?)

II) Record-Lists for FO-29 and other Satellites. However I don't know
if we need too many Lists for each one Satellite or is enough
a single List for all LEOs... let me know.

That's all folks ! Thanks for reading.

73, Mak SV1BSX

*THANKS also for updates - comments to:
EB3JT
KO4MA
KB2M

Date: 2007-01-31 08:40:39 UTC
From: John Hackett
Topic: 607 Message: 608

Hello Mak,
I hope you do make a list encompassing *ALL* satellites.

I can contribute with LA to ZL on AO-13.

LA to JA on FO-20 ...

(both believed to be records for these satellites) ... using 100% home brew equipment

(except for the coax and connectors) ... I had to buy! those.

ZL is the antipode of LA so you can't get much further than that via a satelllite until somebody activates a repeater on the moon ... which, as you know, some people still call Oscar 1 so maybe
I should state that I used an OSCAR class station *NOT* an EME class station.

Really, it was just a case of being in the right place at the right time on the right orbit with the
right propagation ... a monkey! could do it if you gave it enough bananas.

As you already know ... in those days my power never exceeded more than 3 watts from the rig.

These days I'm a *BIG GUN* with my 5 watts ... (which is adequate if one actually uses an aerial).

As you'll also know, I'm not a great fan of multimode rice boxes so the above is intended to illustrate that you *DON'T* have to be rich or have the latest "all-singing" "all-dancing" equipment to participate.

PS.

I do still have the QRP QSL's.

73 John. <la2qaa@...>

CC'd to the group.

609. Chat-room is OK

Yahoo group: eu-amsat
Date: 2007-01-31 09:12:30 UTC
From: SV1BSX
Topic: 609 Message: 609

Hello,

the "Chat-room" working perfect now. Like the previous ON4KST's chatroom is usually... empty-without users, but is always open, 24 hours - every day and will be open for the next ....100 years (in contrast with ON4KST's chatroom) !

I would like to write just a few tips:

This appication running under JVM (Java-Virtual-Machine), it needs
IE (Internet Explorer) version 5.05 or newer.
Under FireFox we had some problems, but now is OK.
You need a broandbad connection for good operation. I tested also with
DialUp connection (56Kb), seems to be OK but I don't know what happens in case which
the users are too many. May be the delay is too big.
I tested also with Windows98SE and IE 6 without problems.

XP-Windows they have NOT Java application as default with IE, but you can
download this add-on from Internet for free. If your PC with XP running for a
long time, 99% you have downloaded already the Java-machine, is absolutely
necessary for several Web pages.

So, just try to login into our chatroom. You do not need password and please,
type your callsign and your name (ie SV1BSX Mak).

If you have the JVM alredy under your IE, then probably you will enter into
chat-room without problem. DO NOT register your call, it is not necessary.
Just type your call & name into CONNECT-field and press ENTER.
After that, wait a few seconds to LOAD the JAVA. A new window will appear
on your screen with message:

YOU HAVE JOINED the EU-AMSAT Group
Welcome to our live chat.

If you received that, you are OK. You have 100% syccessful LOGIN and
you can type into "yellow field" your messages in order to post these into
Chat-room.

If you want to prevent the advertising, "Click-ON" the BUTTON with 4 small
arrows (FLOAT Screen), This way you have "FullScreen" without advertisements
into your screen (recommended).

The chat room is very nice. It has SOUNDs in order to
ALARMing other users (if sleeping !), it has Smileys- funny faces, BOLD
Fonts, you can change Colors in your Fonts, Private-chatroom between 2 users
and many-many other Goodies ! Try it! It's very FUN !

Now, If you can NOT connect, probably you need to install the JVM or you
have some other problem.

With FireFox is simplest. Follow just the same method... if your FireFox needs the JVM it can be download it easily as requested ADD-ON program.

In case you have still problems with LOGIN, let me know.

The URL of chatroom is:

http://sv1bsx.50webs.com/satchat.html

610. ADXOA _ Annual ODX Award

Yahoo group: eu-amsat
Date: 2007-02-01 01:16:46 UTC
From: nader omer
Topic: 610 Message: 610

Hello Mak

Yes it is a nice idea to have award of ODX

An award can be given every year (ADXOA _ Annual ODX Award) to the 3 top dx qsos (6 hams) , so every year we will have an award to work for it .
I think this will increase the activity among the old and new hams
We can retrograde calculate the top ranks of the previous years and issue and ADXOA for them
let us start work for the new 2007 ADXOA

Date: 2007-02-01 11:05:17 UTC
From: Gennadi Klevtsov
Topic: 611 Message: 613

Hello Makis and the group,

My opinion, to competite for the best ODX via satellite
every QSO should be confirmed by exact QRA locator, 6 symbols.

Some towns, like Moscow, for example, have about 45-50 km
from one end to another, but all stations in KO85 field...
But competition is for ODX, not VUCC award!

Otherwise, every chaser for annual award must to confirm
exact qra-locator with additional information for the callsign
from a good source (QRZ or RAC callbook).

From: SV1BSX
Topic: 611 Message: 614

Hi Genna & Group,

I agree with you but the problem is a bit complex sometimes. For example, several QSL-cards havn't printed Locator. So, if somebody received a similar card and unfortunately (for him !) this card is for confirmation of a super-duper DX,
this guy definitely is not blameworthy because the other operator has incomplete QSL card.... !

So, we need some basic rules in AODXA for a fair competition.
Yes, definitely we need a 6 digit Locator . I agree.
But in case where this 6-digit Locator is NOT printed onto QSL card, what should be acceptable for the Award?

The "printed City" on QSL-card? QRZ? CBA? something else?

I think it is necessary to create now the Rules in order to prevent later possible mistakes, at this point. As the "longest distance" parameter is major for the ODX , a correct, clear and valid regulation is very important.

Another similar problem is about the "printed" Satellite.
The majority of QSL-cards havn't a Blank-field in order to write the name of Satellite. OK, usually is obvious that from FREQuency-field , ie 145/432 MHz.

But if the card has only the Uplink (432 MHz) or Downlink (145 or 29 MHz),
without the name of Satellite, this QSL could be acceptable?
(I wonder because I've already received this kind of card !)

I'm waiting for your opinions/suggestions.

615. AO-27 timer-drift

Yahoo group: eu-amsat
Date: 2007-02-01 15:09:41 UTC
From: SV1BSX
Topic: 615 Message: 615

Hi all,

today I was listening 2 orbits of AO-27. The first (#69.611) was over S.Arabia.
Note: the Satellite it could be active around ~12.40Z, but at this time I heard
with surprise the ended packet-sound ! Precisely at 12.41Z was "OFF".

It was strange for me but I was not 100% sure if my PC-time drifted, or if my
Kepls was good enough.

In the next orbit (#69612) the AO-27 it came from my South (Africa) and yes, now
it was obvious the time-drifting. At 14.15Z over South Libya, the repeater was
unexpectedly "ON"... !
I called 2-3 times CQ Sat but the jamming from Arabian stations was too heavy.
After 1-2 mins, IZ1GZA answered to my CQ, but I had problem with my access
on Satellite, due to Arabian-QRM and the QSO not completed.
However I confirmed that, AO-27's close-down was for 2nd time too early,
precisely over Italy !

I checked my PC with another, nothing wrong with clock & Kepls. Definitely the AO-27
has a drift on his timer, and now is "ON" about 5 mins earlier than normal
(maybe IZ1GZA can be confirm this event as 2nd witness) .

Hi,
Im new to the amateur satelite so please forgive me if this has been asked before!!! :)
Im using a 847 and have tried to work a few sats including vo52

This is how mine is set up rx 145.870 usb and tx 435.22lsb
I have it tracked so when i change my rx the tx also changes.
I can here the qso's on the sat but not myself.
Ive also tried the inverse track rx on 145.870usb and tx 435.28lb

What am I doing wrong??!!!

Thanks a million for any pointers!

Hello Tony

VO-52 has a GIGO-Transponder. This means "what is Going In is what
is Going Out". If you send in USB you will receive in USB, the same
in LSB and FM. But FM is forbidden. If you calculate also with Doppler,
you are doing all right.

I think you'll find VO-52 is an inverting transponder....While Tony has the upper and low sideband parts correct, The freqs he mention do not line up. Best bet is to start in the middle of the passband with the vfos unlocked and tune the tx until you can hear yourself....

Gentlemen!,
In particular EI4GHB and HB9SKA.

I think you'll find that VO-52 is an INVERTING transponder. That is to say,
if you transmit on LSB you will receive on USB ...

NOT as Thomas HB9SKA suggests ...

Hello John

I am confused now. I have the info about the GIGO principle. It is
also possible, to send in FM over VO-52, but for lineartransponders
not "allowed" in general. Can you explain me the Indian Transponder
please ?

For my excuse, I was never active over VO-52. I have the wrong
polarisation for my 2m X-Yagi.

Thanks and 73

...definitely VO-52 has "Inverted" transponder! 100% sure about that. LSB-Uplink / USB-Downlink.

Well Tony, as an "old-fashion Ham" I don't know about new "top-models" transceivers. But I can work very well the Satellites with simple transceivers, manually. For VO-52 I suggest you:

tune your RX at 145.900 USB without "tracking" to TX (this is the "middle" of VO-52 Downlink passband). The "correspondense" Uplink frequency to 145.900 USB is 435.250 LSB.

BUT:
1)because we have the "DOPPLER effect", when VO-52 rising (AOS) you must be tuned your TX around 435.240 LSB, that means -10KHz lower of 435.250 MHz.

2)During Satellite moving between AOS-TCA, is necessary to increase your UpLink frequency from 435.240 upto 435.250, in order to be able to hear your voice in DownLink (145.900 USB) clear enough.

3)Precisely at TCA the Doppler is 0 (Zero), so at this point (only) we have equation between Upnlink-Downlink without frequency-drifting due to Doppler effect. That means 435.250 Up (LSB) / 145.900 (USB)Downlink.

4)Between TCA-LOS it's just the opposite. Now you must increasing your Uplink upto +10 KHz close to LOS. Begigning from 435.250 LSB at TCA, your Uplink must be increasing upto 435.260 (near to LOS) always trying to hear your voice into 145.900 USB clear enough.

This is a simple "manual" technique in order to operate the bird.
But keep in mind, VO-52 is difficult Satellite due to low height from Earth surface. That means very fast Doppler (especially close to TCA) and in any case it is not the easiest Satellite for "newcomers".

Good Luck with VO-52

623. Re: [eu-amsat] Re: VO52.

Yahoo group: eu-amsat
Date: 2007-02-22 01:55:36 UTC
From: John Hackett
Topic: 617 Message: 623

Hello Thomas,
Here is the pertinent information on the linear
transponders of VO-52 aka Hamsat.

Mode U/V (B) Linear Transponder (Inverting): Operational
Uplink: 435.2200 - 435.2800 MHz SSB/CW
Downlink 145.8700 - 145.9300 MHz SSB/CW

Mode U Beacon: Operational
Simplex: 145.8600 MHz CW

Mode U Beacon: Non-Operational
Simplex: 145.9360 MHz Carrier

When you hear the CW beacon it is William's PE1RAH Dutch transponder that is
operational.
When you hear the carrier only, it is the Indian ISRO transponder that is
operational.

As you correctly summise, FM is a *VERY* inneficient satellite mode with
it's "capture effect" and "mine's bigger than yours!" effect and
consequently does *NOT* encourage good operating proceedure on a satellite.
As you correctly state, it is to be frowned upon on a linear transponder.

It's easy to confuse VO-52 (LINEAR) with AO-51 which *IS* an FM transponder.

73 John.

Hello Tony,

I'm also using FT-847 for satellite .
Here is my setup of satellites memories for FT-847

Satellite Mode TRACK Uplink Downlink

AO-7 A Nor 145.900 usb 29.450 usb
AO-7 B Rev 432.150 lsb 145.950 usb
VO-52 B Rev 435.250 lsb 145.900 usb
FO-29 J Rev 145.950 lsb 435.850 usb
AO-27 J Rev 145.850 FM 436.795 FM
AO-51 J Rev 145.920 FM 435.300 FM
SO-50 J Rev 145.850 FM 436.795 FM

Of course, there is a middle of satellites subbands
and you need to take in account the doppler shift every
time, when you tracking satellite.

May be this information could be useful for you.

Hello Tony,

Sure, all these analog satellites are active now
so you able to work.
Do not forget to add so called PL-tone (67Hz) to your transmitting (uplink)
signal for AO-51 and SO-50. This procedure is described in
Operating Manual of FT-847. Specially for SO-50, because look like
AO-51 now always open for any uplink! Otherwise you will not able to
open satellite!

Good luck and see you on satellites!

627. Antenna advice??

Yahoo group: eu-amsat
Date: 2007-02-22 12:33:10 UTC
From: Tony Gallagher
Topic: 627 Message: 627

Ok, one more question! Hope you dont mind!! :)
Im using a Moonraker co-linear, simialr to the Watson 300.
6db gain on 2meters and 9db on 70cms. Due to planning problems its in the attic. Not ideal! Also i undertand that a co-linear loose's the sats once theyre overhead,
Can anyone suggest a good dual band, (if possible), discret, non-tracking antenna? It'd be great if there was an ant i could use in my attic.

Thanks one more time!

Tony,

if you want a non-tracking antenna , the only
one that is good enough for Sats it's the QFH
(QuadriFilar Helix)antenna. The QFH is isotropic
antenna with Circular polarization (and a small Gain).

Disadvantages: this kind of antenna is compromise for
our LEOs, you don't expect something spectacular in
the receiving and definitely you need 2 antennas (V +
U). A LowNoise pre-amp helps for better performances.
Switching for Circular-polarity is NOT possible (is
made as RHCP or LHCP only, depending upon
the construction.)

Advantages: no rotator-elevator needed. The UHF-model
is very small and definitely easy to put it in your
attic. The QFH offers receiving 10-15 degr above the
horizon between AOS-LOS with minimal fading (including
the overhead pass).

Hello Mak and Tony

An other solution is the Lindenblad Antenna. See at
http://www.amsat.org/amsat/articles/w6shp/lindy.html

Hello everybody!

I must admit that years ago I had quite decent results with simple antennas (1/4 wave homemade GP with only one radial - some may remember the "boomerang" CB antenna of yesteryear) both for the uplink and the downlink. A simple antenna with a preamp grants a LOT of traffic, especially with loud birds such as VO52.

I have just ordered a pair of big wheel antennas for 144 and 432 and will install them shortly. I will report on results.

635. About VO-52

Yahoo group: eu-amsat
Date: 2007-02-23 12:33:55 UTC
From: William Leijenaar
Topic: 635 Message: 635

Hi AMSATs,

The HAMSAT (VO-52) has two inverting transponders, and this is for sure as I designed one of them myself haha...

Unfortunatly for long time I didn't worked any satellites, including the HAMSAT.
I seen that someone mentioned that the 145.860MHz beacon is on. This is the frequency of my transponder beacon, what suggests that ISRO switched on my transponder again ???

As my station is not capable of working the satellites for now (HAM computer crash, need to repair antennas from last storm etc) I like to hear from the current available satellite hams how HAMSAT is doing and if my transponder is on again ??

The bad thing is that I have to little time to get my station on air again (only free time in evenings) but a good thing is that I have done lot of work in a new transponder design. In short time I will show some results on this project, what is a small sized MODE-UV transponder design (30kHz Bandwidth) that I want to sell for interrested hams, clubs, balloon projects, or satellite projects.
This to make linear transponders more easy available, and with this action to get more linear transponders in future (balloon, satellite) projects. A soon follow up will be a version with 29MHz as the input or output frequency, and versions with smaller bandwidth etc...

Has anyone also new about P3e ?
After I delivered my MODE-UV transponder in Marburg I didn't hear any news from AMSAT-DL for long long time. Will it ever be launched ??? and will Mode-UV be available ????

Topic: 637 Message: 637

Hello,

for anyone interested about QFH, I have added on ANTENNAS folder a very good article from QST, by W3KH. It is the most informative discription that I have ever found, with very good explanation about these antennas and
100% correct theoretical background (in contrast with other aricles, Web-pages etc where usually the discription is NOT correct).

http://groups.yahoo.com/group/eu-amsat/files/Antennas/QFH%20antennas/

Sorry if the PDF-file is not clear enough, but I have only this copy.

I have also another excellent article in PDF about UHF QFH-model from Radio-Rivista, by i8CVS. Unfortunately this file is not in English but in Italic-language.
Anyway, I will upload it also ASAP.

Hi,

yesterday morning I had a QSO with 9K2YM on FO-29 (12:07 UTC), "new one" for me on SATs. Just keep in mind, he is active during the last days.
I met him during FO-29's pass over W.Asia. I also noticed that, probably he has some problems with Doppler-correction (as newcomer?), however he has "large ears". Just looking for him 1-2 KHz up or down during the QSO! (Happily for me, the FO-29 was without traffic).

Good luck

Hi AMSATs,

Due to my qrl I am not qrv anymore on the satellites, just because I will fall asleep when I have to wait for another pass to come hahaha... On the other hand I still have some few hours left dayly, so I used these hours to design a new transponder hihi...

My goal this time was not a satellite design, but a design that can be used in general, think off terresterial, balloon, but ofcourse satellite use is also welcome :o)

At the moment I already have one device working, and it performs very well like its prototype...
I am still doing tests with it because I can use the data for improving it when needed.

In a short rush I made a small website for people who are interrested.
Just have a look at:

www.qsl.net/pe1rah/LE002.htm

Have a nice day and happy satellite hunting,

73 de William PE1RAH

Thomas,

this is fantastic! First news we get about P3E in a looong time!

You could perhaps post them onto the AMSAT BB as well.

Very useful, thank you very much!

Hello Piero

Really, so looong ? :-) Look here:
http://www.uk.amsat.org/index.php?option=com_content&task=view&id=380&Itemid=68

In this group you can find also my past postings about P3E.

73 Ciao

Hello Chaps,
When I instigated the "distance on AO-7" suggestion to Mak
I had used a hotel location + distance program I'd found on the Internet.

However, out of interest, I just tried DK3VN's Maidenhead Grid Square
Conversion & Distance Calculator.

It turns out that the distances between two particular locators is
over 1000 km !! more using this program than the program I originally
used.

However, so as not to confuse the issue, I'll leave my original claims
as they are ... (in fact 1000km shorter than they actually were) ...
but be aware ... (Mak, note this) ... for validiting "awards"
everybody should use the same calculator program.

Hi John

What do you like to calculate ? The distance between 2 OPs on earth or
via satellite ? If via satellite you have to calculate with the Range.
Add your Range to AO-7 with them of your QSO-partner, then you have the
distance your signal is going thrugh AO-7. Right ?

:-) Nice I could help you :-)

This is also the reason, why every and all QSOs via satelltes are DX-QSOs.

647. LA2QAA's STUPIDITY,

Yahoo group: eu-amsat
Date: 2007-03-09 16:53:49 UTC
From: John Alan Hackett.
Topic: 647 Message: 647

Hello Folks,
After Thomas corrected my stupidity re distance
measuring (AO-7) my "results" now seem a little more acceptible.

My QSO with Frank K9CIS in EM59MV from LA2QAA in JP33WB on
the 24-02-2007 at 13:26 on orbit 47708 turns out to be 7700Km
and not 5600Km as I originally wrote.

However, still not the best LEO DX, my best being a QSO I had
between Frei Island and Japan on FO-20 (unconfirmed).

Best *confirmed* on an LEO are the regular 8428Km QSO's I used
to have with AL7JK in Eagle River, Alaska in 1996 on FO-20.
(QSL's submitted to Mak).

Thanks again Thomas.

73 John <la2qaa@...>

648. LEO DX

From: John Hackett
Topic: 648 Message: 648

Hello Mak,
After Thomas corrected my stupidity re: distance
measuring, my "results" now seem a little more acceptible.

My reported QSO with Frank K9CIS in EM59MV from LA2QAA in JP33WB
on the 24-02-2007 at 13:26 on orbit 47708 turns out to be 7700Km
and not 5600Km as I originally wrote.

However, that's still not my best LEO DX, my best being a QSO I had
between Frei Island and Japan on FO-20 back in 1996. (unconfirmed).

My best *confirmed* QRP QSO's on an LEO are the regular 8428Km QSO's
I used to have with AL7JK in Eagle River, Alaska in 1996 on FO-20.

I've attached a couple of QSL's showing his location. As you know,
mine is JP33WB. 63:00:00N and 07:48:00E. Frei Island.

PS.

Note the power ... 5W ... (25w EIRP) ... and we had regular skeds.

73 John <la2qaa@...>

No no, you are not stupid ;-) But hmm...
How have you calculated the distance now ? Have you ascertained the
ranges from your QTH and the QTH from your QSO-partner with the
QSO-date and old kepler-data ? This is the way I would go, but it is
very expendable.

From: John Hackett
Topic: 647 Message: 650

Hello again Thomas,
I "backpeddalled" Instantrack to the dates
concerned and added the distances from each QTH to the satellite. However,
Mak informs me that this is *NOT* correct and the distance should be
calculated in a straight line from QTH to QTH.

That does seem rather odd for a satellite contact since the propagated
signal is traversing the ionosphere twice !! ... on two different
frequencies ... which makes it quite different from a ground based QTH to
QTH QSO where the signal only traverses the ionosphere once ... and on the
same frequency.

My point is still vald. All distances should be calculated using the *SAME*
program. Somebody should decide WHICH program to use. Like the various
doppler calculation programs ... they don't all provide the same results.

Topic: 647 Message: 651

...well John, you are right about which program is acceptable
in order to be able to calculate the distance correctly.

I had (& have) the same question-mark. As you know, I have received
dozens of QSL-cards for OSCAR7-DX list and yes, sometimes I
wondering also what to do with several QSOs that sent me without
recorded-distance.

That it's probably a good "point" in order to take here in EU-Amsat
a final dicision about the "basic requirements" of ODX-list.
(A mere example is now on page:

http://sv1bsx.50webs.com/oscardx/odx.html

However, the calculation of distance always calculated in a
straight line from QTH to QTH and, I believe that is correct and
effective. (Can you imagine a QSO before 30 years? How is possible
to find someone nowadays the Keps of AO-7 ... 30 years before, in
order to be able to calculate the height of AO-7 in these days?!?!?)

Unfortunately, last period I'm very busy with my job and the final-
page is delayed. But any suggestion - idea is welcome for the best
competition of OSCAR-7 DX Award.

73, Mak SV1BSX

Topic: 647 Message: 652

Mak,
I agree with you ... except for 1 small point, it's not necessary to
go back 30 years in the case of AO-7 since it's (almost) sun synchronous.
It's just necessary to backtrack your tracking program to find an (almost)
identical orbit like I did with InstantTRACK.

The actual QSO I had was in 1996 but I found an identical orbit just 11 days
ago (the latest kep element set still includes FO-20).

As the main moderator of the group, and organiser of the proposed award I
suggest you !! decide which program to use for the calculator... different
people would probably have different suggestions of their own preferences so
lets not waste time on a referendum, just make a decision ... since
everybody must use the same calculation there'll be no reason to complain
anyway.

My next "suggestion" is for you to put the chosen calculator in an "AWARDS"
map here on the
eu-amsat group.

653. Satellite QRP.

Yahoo group: eu-amsat
Date: 2007-03-10 09:57:38 UTC
From: John Hackett
Topic: 653 Message: 653
Attachments: 1 described; binary payloads are missing from this source WARC

Hello Al,
Here are a couple of QRP QSL's from AO-13. As you'll see, they're endorsed for either 3 watts or 5 watts (15 or 25w EIRP).

I have DXCC confirmed with such AO-13 QRP QSL's but was just too bone idle to apply for the award.

The "grand tally" though is for CW QRP (217 countries), SSB QRP (143 countries) RTTY QRP (211 countries) all on 20m on the homebrew phased vertical array that appeared in various 'rags'.

The AO-13 QSL's ought illustrate that you *DON'T* need to follow "mine's bigger than yours !!" recommendations for equipment. (You know my !!! economy).

Since I've got me' bragging hat on I'll bat this over to the group as well.

Fine! if you can afford the latest all singing - all dancing rig but it's *NOT* necessary.

Recommended reading for satellite ops at <http://www.observations.biz/> "How much power is enough". (we might as well give THE TWISTED PAIR efforts a plug as well)

The "AMSAT - Amateur Radio Satellites" poster contained the following words on P5A:

GO-Mars - Targeting the Red Planet:

With the powerful propulsion system and the AMSAT-DL electronics integrated into the P3D satellite structure, the cornerstone has been laid for departing Earth orbit in the direction of Mars.

In addition to its functions as a research platform as an amateur radio relay between Mars and Earth. The Mars mission, designated P5A, can even take along a module for landing. The next favourable opportunity for launch of the AMSAT-DL Mars probe is in 2009. Work has already begun on the Mars mission as well as a test and training satellite (P3E) to be launched before the Mars mission.

661. AO-51 Field Day Mode L/U and V/U dual repeaters

Yahoo group: eu-amsat
Date: 2007-03-30 01:03:32 UTC
From: Andrew Glasbrenner
Topic: 661 Message: 661

For Field Day this year AO-51 will be in a dual repeater mode, with the following frequencies:

L/U repeater
Uplink 1268.700 FM, no PL tone
Downlink 435.150 FM

V/U repeater
Uplink 145.920 FM, no PL tone
Downlink 435.300 FM

As a reminder, both the AMSAT and now ARRL Field Day rules state only one completed QSO per FM repeater satellite. Please adhere to this rule so that others may have an opportunity to make a QSO. Also, all stations are asked to please only transmit when they can hear the satellite, and please use full duplex (with headphones) as a courtesy to the other users. Those stations planning on using circularly polarized antennas please remember the 435.150 downlink is left hand circular polarization (LHCP), and the 435.300 downlink is right hand circular polarization (RHCP). Stay tuned to AMSAT ANS bulletins or the AO-51 News page http://www.amsat.org/amsat-new/echo/ControlTeam.php for practice sessions of this mode to be scheduled several times between now and Field Day.

73 and Good Luck!

Exactly Mak

You have taken my words out of my mouth! John don't mind about the LEO'S and enjoy the place in the mean time. HEO will be your solution and the same applies in the Pacific south where they surely feel very lonely now.

Hello All

If I would be a millionaire, I would have my home ON the mountain ;-)

> HEO will be your solution and the same
> applies in the Pacific south where they surely feel very lonely now.
>
HEO will be the solution ? Hmm... I live in Switzerland also near
a mountain. But the mountain is more a hill and also not so high as
John's. I had no chance to make a QSO over AO-40 in mode-S. With AO-10
and AO-13 it was allways difficult at low elevations to operate over
"my" hill on 70cm. If you live in a mountainous region, you operate
better over satellites with a high inclination like the LEO's, not the HEO's.

671. AO-7 Web-Log

Yahoo group: eu-amsat
Date: 2007-04-18 20:01:40 UTC
From: SV1BSX
Topic: 671 Message: 671

Hi all,

I wondering about the "entry-rule" into Emily's Web-LogBook for AO-7.

Looking about my personal score, I noticed that the LOG add points in each one callsign depending upon the number of new-QSOs. For example, if your score is 500 and you have a new entry with 3 new QSOs, the new score should be 500+3= 503.

However, I noticed that my personal score was 188 and after my last entry with 3 QSOs the new
score is ..190 and not 191.

Am I missing something here?

73, Mak SV1BSX

PS: I'm not complainer... just I wondering.... Emily's LOg is GREAT-Tool.
Thanks Emily for your great job.

From: SV1BSX
Topic: 672 Message: 674

Hi Terry & Group,

unfortunately, FO-29 is "OFF". That confirmed
yesterday by several Hams in Amsat-BB and as
we know that happened between #52709 and #52710 orbit.
In the first-half of #52709 orbit the Satellite was
OK, I heard my CQ-CQ clear on Downlink when the
Satellite was over Asia but, nobody answered to my
call.

Then, FO-29 continued over North pole, USA and SE
Pacific Ocean. At this point became into an eclipse
period for about 26 mins and over Antarctica the
number of orbit changed to #52710.
Probably, somewhere between North pole - Antarctica
of #52709 orbit the Satellite closed-down, for unknown
reasons.
The most possible scenario is that, it might be
turned-OFF during eclipse period, probably due to low
power of batteries. (???)

Yes right Terry, we all have to get older and the
FO-29 definitely is an old-bird, I think it's 12 years
old! (Very long time for an amateur Satellite in cold
Space!)

However, I hope to listen it again as it was
the most reliable, stable and accurate LEO satellite
orbiting in a height which offering good enough
DX-windows.

AO-7 is higher, yes, but without batteries...
on the other hand HamSat (VO-52) is great, but too
low.

So my friend "Cross your fingers" for FO-29 !

73 & have a nice weekend

Hi all,

just added a new FOLDER (into "Files" directory)
named "DUBUS". I will upload on it some PDF files
from the famus European electronic magazine, like 23cm
transverters, GaFet LOW-Noise preamp etc.
Most of them, they are "State of the ART" about electronics,
even if they are 20 years old and definitely the "base"
for later designs.
Today added only the "23cm Folder". You can find inside
the well known DB6NT 23cm transverter.

During the next days I will put about 50 more files in PDF format.

Good reading!

73, Mak SV1BSX

677. SSETI-ESEO Launch Date

Yahoo group: eu-amsat
Date: 2007-04-24 16:42:30 UTC
From: Trevor
Topic: 677 Message: 677

SSETI-ESEO Launch Date

The launch date for SSETI-ESEO, the ESA led student satellite project intended for Geostationary Transfer Orbit (GTO), has been delayed by approximately one year. It had originally been hoped that this satellite would be a secondary payload on Arianespace launch from Kourou in late Nov 2008 but it now seems that the expected secondary payload opportunity will not be available.

Although this delay is regrettable it will give the various teams much needed extra time to finalise and test their systems.

A BBM - "Breadboard model" of the satellite systems and payloads is being produced at the ESTEC facility in the Netherlands for testing purposes. This will commence operations during this summer.

Work continues to develop the AMSAT-UK communications package that is planned to provide a 435 to 2400 MHz (Mode U/S) linear transponder using both analogue and DSP based systems. It will additionally downlink telemetry at 400 bps and provide command and ranging facilities.

Full details of the project are available at http://www.uk.amsat.org/ click on "News Archive" and then "SSETI".

There will be a presentation on SSETI-ESEO at the AMSAT-UK International Space Colloquium which is being held at the University of Surrey, Guildford, England from Friday 20th to Sunday 22nd July.

This event is open to all Amateurs and SWL's and there will be a special beginners session aimed at newcomers to the exciting world on Amateur Satellite operating. For further information see http://www.uk.amsat.org/colloquium

AMSAT-UK produces a newsletter Oscar News packed full of Amateur Satellite information. For membership details contact the secretary Jim Heck G3WGM

...Hmmm ! How nice!

If there is not available secondary payload opportunity for
SSETI_ESEO, I suppose just the same for the P3E as the availability
of Arianespace for similar payloads seems to be very difficult
before ...2010!
That means P3Express ST.BY. for 1-2 years more... Am I wrong?

I understood the plan was to have P3E in orbit at least a year before the launch of the Mars Orbiter P5A so they could check out the systems they proposed to use on the Mars Orbiter. That would give them time to make changes to P5A if that was found to be necessary.

The launch windows for Mars Orbiter P5A are either 2009 or 2011.

Hello Mak and group

I think, P3E will go with the new Soyuz into orbit from the also new
launchplace in Kourou.

From: John Hackett
Topic: 101 Message: 681

Hi All,
Somebody knocking 10 kinds of the brown stuff out of AO-7 this morning on orbit 48458.

Careful !! with the power chaps or we'll lose this one as well.

The recommended operating proceedure can be found at ...

<http://www.planetemily.com/ao7/ao7log.php> Just click on "Using AO-7".

The more potential new users who are aware that you *DON'T* need 100w to a 10 element beam, the more likely it is that AO-7 will continue to provide excellent analogue signals.

Hi John,

well, I suggest to make a BLACK LIST (and publish
that anywhere, like Amsat-BB etc).

Why not?

This way I believe that, every LID(= bad-operator)
will be more careful in order to avoid the LIST!

After the closed-down of FO-29, we have to care much
more about AO-7's good-health.

Hi MaK,
I'm not so sure a BLACK LIST is the way to go, however, we most certainly DO! need to be aware of the "alligator" ... (all mouth and no ears) ... problem on AO-7. I read quite recently a post on the Amsat-bb wherea particular station was "explaining" that one *NEEDS* a linear amplifier to work AO-7.

Absolutely *not* true ... (using an aerial !!!!! might have helped.....LA2QAA & GM1SXX).

Of course, today's FM'ing on AO-7 *may* have been due to ignorance, not deliberate QRM, we'll never know but we should !!! encourage people to LISTEN before transmitting ... after all, it *IS* full duplex.

I'd suggest "education" to be a better alternative than a"black list" ... Alligators will always! be with us with the "mine's bigger than yours!" menality.

A re-read of the recommended operating proceedure would do no harm. This applies to *ALL* satellites.

PS.

LA2QAA and GM1SXX will soon be publishing an article suggesting a way to operate satellites for those amateurs who have severe aerial restrictions or who don't currently own the necessary equipment.

I will of course put a link to the article concerned on the EU-Amsat pages.

Hello Andrew,
With reference to your recent posting on the EU-Amsat reflector ... (of which I'm a founder member, together with SV1BSZ and GM1SXX).

I know for a fact that the message concerned (re: power) has appeared in The Amsat Journal (USA) and Oscar News (UK) countless times, specifically requesting the editors of these magazines to publish recommended operating proceedures for satellites ... because I'm the clown who wrote the regular "Observations From Norway" colums and this is a point I used to *nag* about.

The message has also been aired several times on The EU-Amsat reflector as well as a few national radio magazines ... so I think I've done my bit to get the message across.

73 John. <la2qaa@...>

Well I haven't seen it in 5-6 years in the -NA journal. I do not get the -UK version.

AMSAT has a very high churn rate. There are the long timers as yourself, and a constant stream of newbies who come and go and need education in the meantime.

My suggestion is to submit it again, but growsing about no one else doing it is unproductive. ANd suggesting Ed Long, the -NA journal editor is somehow ignoring some particular issue is borderline insulting. He prints what he gets...so send it in.

73, Drew KO4MA

Drew,

>Well I haven't seen it in 5-6 years in the -NA journal. I do not get the
>-UK version.

That's because I stopped submitting input to the NA Journal ... for reasons that are irrelavant to this particular issue.

>My suggestion is to submit it again, but growsing about no one else doing
>it is unproductive.

Again, please read my original posting. I didn't grouse, I agreed with an opinion offered by someone else and mentioned that previous efforts on my part had had no effect, I also offered an opinion, to which I and everyone else (including you) has a right to do.

>ANd suggesting Ed Long, the -NA journal editor is somehow ignoring some
>particular issue is borderline insulting.

I most certainly did *NOT* suggest Mr Long ingnored anything at all ... therefore my OPINION was
in no way insulting, not even BORDERLINE insulting as you suggest. That must remain YOUR interpretation of it ... I cannot be held responsible for that.

I proffered my 2 bob's worth, I didn't ask anyone to agree or disagree with it.

To recap, I agreed with the comments of the G station who suggested a write up, I mentioned that it had been done several times before (to no avail) and my opinion was that I thought it would have been in the interest of the editor's to publish such information like a recommended operating proceedure.

THIS IN NO WAY CAN BE CHARACTERISED AS A BORDERLINE INSULT ... (your words).

If you find my opinions worthy of criticism, you have that right. As for your suggestion, like I mentioned previously, I've already submitted the suggestion of a recommended operating proceedure, with the emphisis on "power" on several occasions via several mediums.

Perhaps a couple of examples might console you ...

Have a look at <http://www.planetemily.com/ao7/ao7log.php> "USING AO-7" ... (a site I also used to administer). Also, have a look at <http://www.observations.biz> HOW MUCH POWER IS ENOUGH (part 1) ... and the several posting in the last years on this reflector.

I think the texts are self explanitory. I think I've spent enough time and effort on this particular subject.

Should you wish to continue to *shoot the messenger* ... please feel free.

This news story on the new Russian Launchpad appeared at the beginning of March.

Russian Kourou Launch Pad Delay

Commenting on the delay in the construction of a Russian launch pad at the Kourou space center in French Guiana, the Russian space official said workers have been battling with solid rock formations at the construction site and have experienced other technical difficulties.

"This is why the original date for the first Soyuz-ST carrier rocket launch from the space center in Guiana could be postponed for three months, until December 2008," he said.

The 344-million-euro Kourou launch site, located near the equator, will make it possible for Russia's updated Soyuz-ST to orbit heavier cargoes than from the Plesetsk Space Center in northern Russia or the Baikonur launch pad in Kazakhstan.

The project, which is based on a November 2003 agreement between the Russian and French governments, will also allow Russia to substantially expand its commercial use of Soyuz booster rockets on the international market with up to 50 launches by 2010, each costing customers $50 million.

692. How much is enough?.

Yahoo group: eu-amsat
Date: 2007-04-25 21:58:19 UTC
From: John Hackett
Topic: 692 Message: 692

Hi all.
Re: the power debate ... From http://observations.biz
.....
.....

POWER. How much is enough? . La2qaa Feb 2006.

There could be many answers to that question but the correct one regarding amateur satellite communications is ...

"Just enough to maintain effective communications".

For instance, how many people reduce their power as the satellite they're operating on approaches TCA ... (time of closest approach) ... a good operator will, because they know that the use of excessive power is *not* good for the transponder. Case in point. When AO-7 first comes up over the horizon you'll probably need "X" amount of power to communicate effectively.

However, after 10-15 minutes, as the range decreases you'll find that a 3dB ... (50%) ... reduction of power will have no effect whatsoever on the signal. A *VERY* sensitive S-meter might show a difference but your ears certainly won't.

Hands up those that actually regulate their power to maintain effective communications ... (No, I didn't think so) ... you should try it sometime, you might get a surprise.

By the way, we do know ... (don't we?) ... why most satellites have a beacon?. One of the principal
reason, after telemetry, for a beacon is so that you can regulate your power to be consistent with that beacon, it's your reference. No signal should EVER be more powerful than the beacon.

Naturally, it will also serve as your propagation reference.
.....
.....

For those cases where a beacon isn't operative (read AO-7) you can use VE2DWE's sensible suggestion of tuning up and down the band and regulating your power to be consistent with known non-alligator stations.

Alligator = all mouth and no ears.

Remember the old adage, if you can't hear them you can't work them.

A decent receive aerial ought to be the most important part of an amateur satellite station.

(time of closest approach) ... a good operator will, because they know that the use of excessive power is *not* good for the transponder. Case in point. When AO-7 first comes up over the horizon you'll probably need "X" amount of power to communicate effectively.

However, after 10-15 minutes, as the range decreases you'll find that a 3dB ... (50%) ... reduction of power will have no effect whatsoever on the signal. A *VERY* sensitive S-meter might show a difference but your ears certainly won't.

Hands up those that actually regulate their power to maintain effective communications ... (No, I didn't think so) ... you should try it sometime, you might get a surprise.

By the way, we do know ... (don't we?) ... why most satellites have a beacon?. One of the principal
reason, after telemetry, for a beacon is so that you can regulate your power to be consistent with that beacon, it's your reference. No signal should EVER be more powerful than the beacon.

Naturally, it will also serve as your propagation reference.
.....
.....

For those cases where a beacon isn't operative (read AO-7) you can use VE2DWE's sensible suggestion of tuning up and down the band and regulating your power to be consistent with known non-alligator stations.

Alligator = all mouth and no ears.

Remember the old adage, if you can't hear them you can't work them.

A decent receive aerial ought to be the most important part of an amateur satellite station.

694. FO-29 back again ?!?

Yahoo group: eu-amsat
Date: 2007-04-26 14:39:07 UTC
From: SV1BSX
Topic: 694 Message: 694

Hi all,
don't "shoot" me if I'm wrong, but I think FO-29
is back!

Today 26 April 2006 between 14:10-14:16 UTC
(#52.792 orbit) I HEARD (!!!) a continue carrier in
FO-29's beacon frequancy !

I was starting to monitor the frequency with a delay,
I forgot this time the pass of Satellite (every day I
monitored it.)

Well, the Sat was over Libya (N.Africa), close to me
with 32 Degr. Elevation, in very good range for me.

Looking for any activity I tuned my receiver to Beacon
frequancy and... what a surprise!

I received a strong carrier arround 435.799.
The carrier was following the usual doppler-shift, so
after 6 mins dropped-down to 435.788 MHz !! That
is very normal and confirmed to me the Satellite
signal!

At this point my QTH has no clear horizon (340 degr.)
even if the Satellite was high enough, at 24 degr.
Elev. So after 1 min I lost the signal completely.

Please keep monitoring the FO-29 and send your
reports. May be FO-29 is back again !

73, Mak SV1BSX

695. IRB's and Satellites.

Yahoo group: eu-amsat
Date: 2007-04-26 14:39:24 UTC
From: John Hackett
Topic: 695 Message: 695
Attachments: 1 described; binary payloads are missing from this source WARC

OBSERVATIONS FROM NORWAY. 26-04-2007.

INTERNET REMOTE BASE STATIONS FOR SATELLITES.

Love 'em or hate 'em ... IRB'as are a part of amateur radio.

So ... why would LA2QAA want to use one?. Well, they can! be used for operating satellites.

On a recent (unsheduled) visit to the local horse-spittle ... (I don't like these places, they're always full of sick! people) ... the surgeons positively refused !! to allow me to set up the satellite array in the intensive care unit while they performed renovation work on the pig's heart in LA2QAA's chest ... (oink!).

(PAPPA INDIA GOLF as in smoked bacon, not two legged creature with badge).

Their excuse was that the rotor noise might disturb the other patients snoring ... so lying connected to various hospital type spectrum analysers and other pieces of apparatus has a tendency to put a serious crimp in satellite operating for a while and it initiated the reasoning behind why LA2QAA might want to use an IRB, to get round the issue of being denied aerial privilages.

The following is a short article destined for the Observations from Norway pages on <http://observations.biz>

.....
.....

AMATEUR SATELLITES AND IRB's

(IRB station = Internet Remote Base station).

FOR PEOPLE WISHING TO OPERATE AMATEUR SATELLITES BUT DON'T HAVE THE EQUIPMENT OR KNOW-HOW.

(The know-how can be found elsewhere on this website).

Visitors to the <http://www.observations.biz/> web page will soon become aware that LA2QAA & GM1SXX are always trying to help newcomers to amateur satellite operating by providing hints and tips in their satellite related articles.

Two of the main excuses used by potential newcomers for *NOT* operating on satellites are ...

1) The sophisticated equipment that is necessary is too expensive ...

and ...

2) I don't have the possibility of erecting rotatable beams ...

The facts are, neither of the above arguments are valid because ...

1) You don't *NEED* sophisticated equipment ...

and ...

2) Rotatable beams are *NOT* necessary to work satellites that are in low earth orbit (LEO).

While it is true that AMSAT (The Amateur Satellite Corporation) prefer to promote satellites with "cutting edge" technology that require expensive equipment, there ARE satellites that only require relatively simple equipment ... a flying FM repeater like AO-51 and analogue ... (CW/SSB) ... satellites like AO-7 and VO-52.

Even if you don't have the necessary equipment at home to use any of these satellites, providing you have access to the Internet with at least a 300bps modem (preferably faster) you *CAN* work these satellites using only your computer!!.

Unlike Echolink, which is a 100% Internet based system, an IRB (Internet Remote Base) station transmits and receives via the ionosphere just like any "normal" amateur radio and aerial system. You only connect via the Internet to the remote base station ... the IRB transmits and receives your signal to and from the satellite via the ionosphere.

You can control all aspects of the remote rig directly from your computer keyboard or even use a 3G mobile phone. (LA2QAA has actually done it like this using Remote Desktop for Mobile phones software).

With the VK3UR IRB you can even turn the 70cm aerial remotely as well as choosing an appropriate power level setting, different modes, filters, adjust AF and RF gain etc just as if you were actually sitting in front of the rig. The VK3UR IRB uses a TS2000 transceiver so there are a lot of options.

Before reading further, it would be advisable to read "HOW MUCH POWER IS ENOUGH", part 1 on ...

<http://www.observations.biz>

HOW TO OPERATE THE VK3UR REMOTE BASE STATION FOR AO-7.

First ... read the instructions !!! and familiarise yourself with the rig's controls for changing frequency and the use of filters, operating modes and rotor control etc.

Next, tune the TX to 432.150 Mhz LSB, press "S" on your keyboard, this will put the radio into SPLIT mode, then tune the RX to 145.941 Mhz USB ... make sure you have a suitable tracking program on your desktop that calculates the azimuth and elevation as well as the necessary doppler offset. (LA2QAA

uses NOVA). Now you can remotely turn the 70cm yagi towards AO-7 and operate just as if you were operating from your own shack.

REMEMBER !!! ... set up your tracking software QTH as Victoria, Australia ... *NOT* your home QTH ... otherwise the passes will be (literally) half a world !! off.

Also remember ... to stay legal, you have to identify at least every 10 minutes so you operate with the callsign VK3/YOUR CALL ... it is advisable to mention you're operating via the VK3UR IRB in Victoria, Australia so that the Ozzies don't think you're a pirate playing Silly Sods.

The coordinates for VK3UR are ... 37 degrees, 33 minutes, 43 seconds SOUTH and 143 degrees,
49 minutes, 7 seconds EAST in Victoria, Australia. (Enter these coordinate into your tracking program).

At the time of writing (24-04-07) the IRB is not set up for FULL duplex operation but you should have no trouble at all working ANALOGUE LEO satellites like AO-7 or VO-52 using this method.
The station is already set up for FM use with automatic doppler tracking and tuning for AO-51 or
The ISS ... (see the SETUP menu "special settings", satellite operations).

As well as having the radio interface on my desktop I have NOVA + the doppler corrections visible.
Of course, this won't be FULL duplex operation but you won't have any problem at all working ANALOGUE satellites with this set-up.

As with all satellite operating ... get into the habit of using those rather wierd things stuck to the side of your head ... (he means EARS, folks). LISTEN before you speak. Where appropriate, listen to the beacon BEFORE transmitting and "guesstimate" your power accordingly ... (now you know why FULL duplex is recommended for operating via satellite).

Actually, the MONITOR facility "could" be used if the IRB software was "tweaked" slightly.

You can obtain a password for operating the VK3UR IRB by sending the owner a copy of your current licence ... (providing it's a reciprocal licence with VK) ... to <dave@...>

The service requires no registration or donation fee.

Have fun!.

73 LA2QAA John. <la2qaa@...>
.....
.....

One very useful feature is that an IRB in a location remote from your normal operating position allows you to perform propagation comparisons.

Another is ... (in my particular case) ... soon after I lose AO-7 on certain passes at Frei Island, Norway ... (home QTH) ... I can pick it up again from Reston, Virginia ... (IRB).

The main advantage next to the aerial restriction issue is that an IRB allows those amateurs whom don't have the necessary equipment to try their hand at satellite operation, therefore, hopefully, bringing in some new recruits.

73 John. <la2qaa@...>

Hello All

I am very conservative in such things. If I want to operate via
satellites, then I want to use my _own_ Rig and my _own_ antennas
so I can make my _own_ QSOs. Am I too conservative ?

Hello Frank,
In the course of writing a new article I was just
researching one of my old waffles and noticed that you andI had a 9 minute
(CW) QSO via FO-20 ... 9 years ago. K9CIS got quite a write-up too ! ...
ha-ha-ha. The wheel keeps turning so it was nice to hook up again on AO-7.

I too miss the FO satellites ... they were my all time favourites.

I managed LA to JA on FO-20 and to the best of my knowledge that's still a
LEO record.

So sad to see FO-29 go down but hey!, none of us live forever, it sometimes
just "feels" like we do.

Thomas,
The article in question was not aimed at experienced operators.

As I wrote ... the IRB article was aimed at the potential newcomer who *MAY NOT* have
the necessary equipment and know how to operate a satellite ... but may want to try! ... in other words, an attempt to encourage possible new beginners to satellite operating.

One comment from the USA mentions the fear of "intruders" and QRM. This is unfounded since all IRB control operators require a copy of your amateur license before you're allowed the privilage of using the station ... which of course, is in their own vested interests ... otherwise the station would be down faster than Raquel Welch's knickers in the 60's.

If a "licensed" amateur causes deliberate QRM? ... well, that happens with non-IRB stations doesn't it. As for not knowing the proceedure ... again, referenced in recommended further reading.

Hi John, and Group,

well, with interesting I read all... your page (and
CONGRAT'S for your work), the comments etc.

Firstly, I would like to say that:
I'm not negative to IRB. Seems to be very exciting the
tele-commanding of a ground-station in VK-land (or
anywhere else) in order to talk through a Satellite.
I like this experience... on the other hand I agree
with comment: "it's not the real radio amateur..".

OK, that's clear.

BUT, as I read and studying this system, I believe
that it is not quite simple for a "beginner", without
experience. I think it should be very difficult to
manipulate this system.
I'm afraid that he has... to "fight" with a PC,
several running softwares and of course - with the
"VK-side" station, "hunting" a fast-moving-target,
like the Satellite! And at my opinion, this way
through IRB is much-much harder and much-more
difficult & complex job for a beginner, compared with
a normal Shack operation.

I believe that IRB it's a great "toy" for an expert
Satelliter, in order to take another point of view
about Satellite's operation. It's great to have
somebody the experience to talk on Satellites as
VK/xxxxx ! (and I will try it ASAP).
But as I said, like a "big-boy's toy". Nothing more.

Just my opinion.... "don't *shoot* the... pianist" !

73, Mak SV1BSX

705. Piano players!.

Yahoo group: eu-amsat
Date: 2007-04-27 20:57:26 UTC
From: John Hackett
Topic: 700 Message: 705

Mak,
I wouldn't dream !!! of shooting the pianist ... I might shoot the guitarists though ...
(LA2QAA & GM1SXX) ... You make some very valid points Mak ... and unlike some of our American cousins, we on this side of the Atlantic are able to behave like gentlemen and express opinions without the need to use abuse ... that's great !!! ... and was of course part of the original idea when you and I started this forum.

Well done !!! Mak ... CONSTRUCTIVE differences of opinion ensures we *ALL* learn something.

On reflection, you're absolutely right regarding the analogue modes via IRB's ... the myriad of techniques used to successfully track and tune AO-7 and VO-52 need a bit of "experience" ... however! ... for the simple FM repeater on AO-51 everything is TOTALLY automated ... (tracking, tuning, pass times, auto-doppler) ...the plus side being ... it's *VERY* easy to operate ... the minus side ... the newcomer won't *learn* very much.

I must admit, my sole intention was to suggest a platform for those people who for varying reasons can't operate their own satellite stations ... aerial restrictions, lack of funds etc ...

In my particular case, when I move into a retirement home I will still be able to operate the satellites even if I'm refused permission to erect a satellite array.

As you'll have noticed, lately, we're getting a few more members from VK and NA ... I told !!! you this would happen. A lot of the credit is due to the interesting files submitted (DUBUS etc). I get this magazine but there are a lot who don't so it's a very !!! useful addition.

Another reason is the *LACK* of politics and "flaming" ... like some other reflectors we all know of.

Restricting to "callsigns" was smart !! Mak ... OK, that's enough credit for one mail, we don't want you getting big-headed! ... ha ha ha.

Cheers! Mate.

....I completely agree with your reply, John.

Sorry, it was my mistake indeed.

Just I forgot the FM-birds, as they are always on
the... "dark-side" of my mind. You know, very close to
"Parkinson's and Alzheimer's" part of human brain.

Have a nice weekend

I fully agree with you Mak. But to steer a receiver remotely will
be interesting for a newcomer. This receiver must be fully automatic,
so you have only to click the button for the satellite you want to
receive.

Just my opinion, don't shoot me ;-)

709. 23cm-2m Transverter on eBay

Yahoo group: eu-amsat
Date: 2007-04-29 18:19:55 UTC
From: SV1BSX
Topic: 709 Message: 709

.. for those interested, this TRSVRTer is made from
article which I have added in "Dubus-folder" (23 cm
by OE2PMJ.

http://groups.yahoo.com/group/eu-amsat/files/DUBUS/23cm/

Starting bid 80 Euros or "Buy it now" for 150 Euros
(seller wrote "EUropeans bid-ers only")... not quite
cheap but maybe interesting for somebody in our list.

You can find it in eBay-Germany by following the URL:

http://cgi.ebay.de/23cm-2m-Transverter-nach-OE2PMJ_W0QQitemZ140111012424QQihZ004QQcategory
Z12968QQrdZ1QQcmdZViewItem

(be careful to "highlight & copy" from above "URL"
all letters into your browser!)

Hi All,
Unfortunately, the new Russian stations that "discovered" AO-7 today ... (01-05-07) ... have obviously *NOT* read the recommended operating proceedure for this satellite.

The transponder was FM'ing like nobody's !! business ... my pleas of ... PLEASE!!!! QRP ... to two of them fell on completely deaf ears. Surely, all Hams know what QRP ... (sent as a request - not as an interogerative) ... means?.

We really *DON'T* want to fry the electronics so soon after losing FO-29.

I suspect that some stations don't actually *listen* to what is being said ... but just give the obligatory 599 report regardless !!. I made the request in both English "AND" Russian but the stations concerned didn't reply.

The *infamous* QSB ?? ...

711. FO-29 Operation Pause (Fwd from JARL)

Yahoo group: eu-amsat
Date: 2007-05-05 22:05:43 UTC
From: SV1BSX
Topic: 711 Message: 711

From: Mineo Wakita <ei7m-wkt@...>
Date: Sat, 05 May 2007 18:19:04 +0900
Subject: [amsat-bb] FO-29 Operation Pause (Fwd from JARL)

About "Fuji-3" Present Condition and Operation:
(Although the normal operation is checked, the operation is
stopped for a while.)

It is as a previous report an amateur satellite "Fuji-3" (JAS-2, FO-29, 8J1JCS) of JARL. From 21 April, 2007, although the analog system transponder had stopped, we announce you the subsequent present condition.

On 3 May, Thu. 16:00 (UTC),
We could check an analog system transponder (JTA) of "Fuji-3" was worked to ON and OFF by command from a GS control office and there was no fault in a command system.

On 4 May, Fri., we made turn ON the analog system transponder, and the electric power income and outgo were checked. The rate of the shade was 25%, so the electric power income and outgo turned out that it is in a quite severe state.

Since the check of the electric power income and outgo, the battery reconditioning, etc. are worked, we do as stopping the operation of "Fuji-3" for a while. Although we cause users much anxiety, we consent-wish-do.

In addition, although it may turn ON temporarily an analog system transponder over Japan during an operation dormant period, please refrain from use of transponder such as a loop test and a communication.

Translated by JE9PEL, Mineo Wakita.

712. Obligatory.

Yahoo group: eu-amsat
Date: 2007-05-06 09:58:37 UTC
From: John Hackett
Topic: 712 Message: 712

Hello Al,
Just been listening to an "American" pass of AO-51 ... this should be obligatory for potential new satellite operators ... a perfect example of *HOW NOT* to operate a satellite.

The nearest I could describe it is a bit like a fox in a henhouse ... or ... *TOTAL* chaos ... the FM capture effect workks BRILLIANTLY !!! (not) on satellites with many users.

Seriously ... NASA can get away with it (FM) with one (1) user but when you have 20 (literally) in the passband the chaos is COMPLETE.

I wonder if the designers have listened to something like this ... I'm reasonably sure if they had they'd change their opinion of FM on an "AMATEUR" satellite quick sharp.

Civilian operators just don't have the dicipline and knowledge for SSSH ... (short, sharp, sh*t hot) ... operating but have a tendency to err more towards ... "Errr ... I'm using ... errr ... a pair of .... err grey socks today ... err and the weather ... err is a bit ... errr ... (Satellite goes LOS).

73 John.

I agree with you John. Its like in an ape-house in a zoo. No more comments,
its a shame.

But why American passes ? There are the European passes. Or have I not
understood your "American" ?

...I agree with you John but, on the other hand
several "European" passes are not better, sometimes.

I was listening before 2-3 days on the same Satellite
and somebody was calling CQ-SAT. After 2-3 CQ-calls,
another - 2nd guy (the No2-user), immediately he
called a "new" CQ CQ-SAT. And after the second
CQ-caller, some other guy (third, the No3-user!) he
called another-new CQ-SAT !!!

I was wondering... if the first user was calling CQ,
why the next users called CQ again and they did not
answer to first CQ-er??? Question-mark!

Finally, the 3rd (No3-user) he answered to a... 4th
user (at least the 4th he didn't call CQ !)
The unbelievable story continued, the 1st-guy during
the QSO between 3rd & 4th, he didn't "give-up".
He continued to call CQ CQ-SAT (!!!) between "overs",
when the QSO was in action among 3rd & 4th! As you can
imagine, the No3 and 4 users they spent all the time
of Satellite-pass, in order to exchange
reports and Grid-locators due to the QRM from No1
user. What a stupid-man!

I was listening for about 8 mins and just
one QSO was realised, between 4 users, during the
whole pass. Great!
I can't imagine the scenario with more users !
It was quite enough that. Thanks!

Closing, I have to laugh with your phrase "like the
fox in a henhouse"!
However, by listening a pass as abovementioned, I'm
thinking also the "Babel's tower" in a new "High-tech"
version.

716. Mutual window calculator?

Yahoo group: eu-amsat
Date: 2007-05-06 14:13:36 UTC
From: SV1BSX
Topic: 716 Message: 716

Hi all,

I was looking on NOVA-software for the possible
"mutual window's" prediction between VE-SV via a
Satellite, in order to determine the better passes
between 2 Grid-Locators (or 2 cities).
However, I can't find something useful.

For example, I would like to have the summary-list
(in a print-paper or file/screen)) of AO-7's
mutual-windows between two known Grid-locators for the
next month.

BTW, NOVA offers the possibility to put (and edit) a
2nd "Observer", but I can't see where that could be
help me in order to know the request list.
Also I didn't read any similar discription into HELP
file.

Is it any other software which covers that what I
need, or Am I missing something from NOVA?

Thanks in advance

73, Mak SV1BSX

Topic: 712 Message: 717

Hi Thomas,
As for the wording "American pass" in my post, merely
coincidental, I just happened to be listening via an IRB station.

Personally, I've only ever worked FM on a satellite once ... (OE/W0SL on
AO-27) ... and only then because it happened to be Roy.

I really don't see the point of ... *LA2QAA in JP33WB. 73* ... and think
that FM is a really inefficient use of a satellite when there are many
potential users in the passband ... that's just my personal opinion, I've
never been a fan of FM via *AMATEUR* satellites ... I believe they teach the
potential newcomer the wrong things.

Like I mentioned, it's OK for NASA or single channel/single station
operating but IMHO *not* very suitable for amateur satellites. I had
expected more foresight from the Amsat B.O.D. regarding AO-51.

By the way Luc ... I know !!!!!!!! ... but it will find it's way there
anyway !! since I'm fully aware we have a member of the board on this
reflector.

Mak and I started this as an 'OPEN' reflector and everybody is entitled to
an opinion ... and I do believe they *WON'T* be flamed by other European
operators for actually having the audacity ...
(tongue-in-cheek) ... to express that opinion ... providing that it's
satellite orientated.

I always enjoy and appreciate your sensible comments Thomas.

Mak,
Use InstantTRACK ... it does PRECISELY what you want on screen and
as a printout.

I use both Programs ... InstantTRACK for the actual tracking ... (with
InstantTUNE for tuning) ... as well as NOVA for the excellent graphical
views from Space ... which gives the newcomer a very good understanding of
the footprint and how it moves etc.

I'm an old AO-10/AO-13 user. Then came the MicroSats with Packet Radio
and now we have 3 FM-Repeaters and the CubeSats with telemetry. If we all
are disciplined we can also enjoy the FM-Sats. There are also many newcomers
who get in via FM-Sats in satellite operation. I like all HAM-satellites
and tried all them out, also FO-29. But SSB-transponders in a LEO-orbit
are too hectic for me.

..OK John, tks for reply.

Yes, you are right, InstantTRACK it does that I need,
fast and easy indeed!

Thanks for your help.

721. OSCAR-7 DX list update

Yahoo group: eu-amsat
Date: 2007-05-11 23:16:31 UTC
From: SV1BSX
Topic: 721 Message: 721

Hi all,

The new "OSCAR-7 DX list", including April'07
is updated.

Visit :

http://sv1bsx.50webs.com/oscardx/odx.html

The page will be remade the next month with
much-more interesting QSL cards from OSCAR-7 DX
participators!

"Stay tuned" !

73 and have a nice weekend

Mak SV1BSX

...of course Drew!

If you send me the card, then the "entry" on the
DX-list it will be:

KO4MA - PH7PCF (now is PH7PCF - KO4MA)

First is placed the callsign of "QSL-card" (or
QSO-info) sender.

724. AO-7 log.

Yahoo group: eu-amsat
Date: 2007-05-21 01:34:36 UTC
From: John Hackett
Topic: 724 Message: 724

Hello folks,
A few words about the AO-7 Resource Page log.

<http://www.planetemily.com/ao7/ao7log.php>

I no longer administer this log and as the regulars on AO-7 will have noticed, the log is getting to be in quite a state of disarray.

For 3 months now, continued attempts by me to contact N1DID (ex: W0EEC) via 3 different addresses have produced negative results. To the best of my knowledge Emily alive and well but is devoting herself 100% to the "virtual" community as opposed to the real world.

It should be noted that the log is an *ACTIVITY* log, not a contest log.

Example.

In the last 20 days of May JH3XCU/1 has registered 31 points. Number of QSO's = 0 (none).

Several entries are either incomplete, submitted wrongly or QSO being claimed several times for the same pass ... ie ... 09:15, then again at 09:20 ... despite the facility of the edit own entry system ... (click the hourglass).

Unfortunately, I can no longer do anything about this so unless operators are careful in entering date the log will continue to give a false impression ... which is a shame for the people who do !! use it as it was originally intended.

CONGRATULATIONS !! to Joe K3SZH for passing the 3000 (GENUINE) QSO's.

73 John. <la2qaa@...>

P3E Transponder Readiness Review

Mit dem Treffen der Transponder-Modulbauer am letzten April-Wochenende (27.-29.4.2007) ist das P3E-Projekt nun in eine weitere entscheidende Phase eingetreten.
http://www.amsat-dl.org//index.php?option=com_content&task=view&id=139&Itemid=97

P3E transponder readiness review

With the meeting of the transponder module builder at the last April weekend (27.-29.4.2007) the P3E-Projekt occurred now a further crucial phase.

P3E erh?lt finanzielle Unterst?tzung von AMSAT-NA und AMSAT-UK

Nach dem Gipfeltreffen der Repr?sentanten der AMSAT-Vereinigungen von Nordamerika (AMSAT-NA), Grossbritannien (AMSAT-UK) und Deutschland (AMSAT-DL) in den R?umen von AMSAT-DL und ZEL in Marburg, bei dem sich die G?ste einen aktuellen Eindruck ?ber den Fortschritt der Arbeiten an P3E machen konnten, haben sich AMSAT-NA und AMSAT-UK entschlossen, die Gesamtsumme von 40000 Euro an die AMSAT-DL zu spenden. Mit dem Ziel, den laufenden Betrieb des "Zentralen Entwicklungslabor f?r Elektronik" (ZEL) der Universit?t Marburg aufrecht zu erhalten.

P3E receives financial support from AMSAT-NA and AMSAT-UK

After the summit of the representatives of the AMSAT associations of North America (AMSAT-NA), Great Britain (AMSAT-UK) and Germany (AMSAT-DL) in the areas of AMSAT-DL and ZEL in Marburg, with which the guests could make themselves a current impression over the progress of the work on P3E, AMSAT-NA and AMSAT-UK decided to donate the sum of total 40000 Euro to the AMSAT DL. With the goal of keeping the current enterprise "central development lab for electronics" (ZEL) of the University of Marburg upright.

P3E transponder Readiness Review
Written by Peter Guelzow
Sunday, 13 May 2007
With the meeting the transponder module farmer on the last April weekend (27.-29.4.2007), occurred the P3-e project now a further crucial phase.

Participant: Howard Long G6LVB, Steve Sanger VK6WN/M0CRX, Mirek Kasal OK2AQK, Konrad Hupfer DJ1EE, Tilman Gloetzner DG2TG, Matthias Leupold, Freddy de Guchteneire ON6UG, Michael Fletcher OH2AUE, Janne Peltonen OH1LRY, Petri Kotilainen, Jari Koivurinne OH3UW, Ulrich Mueller DK4VW, Wilfried Knauer DG1OWK, Karl Meinzer DJ4ZC, Peter Guelzow DB?S, Hartmut Paesler DL1YDD, Achim Vollhardt DH2VA, Heike Straube

After in the meantime tank and wiring harness were built into the P3-e structure, "arranging celebration" can be celebrated and the P3-e structure may call itself now "satellite".

In principle stands thereby to the installation and integration of the different modules nothing more in the way. In order to obtain and the status of the individual modules demonstrated get the involved ones this and the further activities, to a "transponder Readiness Review" was invited to Marburg into the ZEL.

After the present timetable those have module farmer still scarcely 3 months time around the airworthy modules to finish. At the beginning of of August 2007 is to then take place the delivery and further electrical acceptance tests in Marburg. Mirek Kasal OK2AQK of the University of Brno has itself to take over thereby ready avowedly with the tests a prominent role, supported by our people before place at the beginning of of October 2007 begins then the electrical integration of the modules in the satellites with appropriate further tests, so that the P3-e satellite is finished in December 2007. From January to July 2008 then temperature vacuum and vibration test of the entire satellite are intended, as well as sufficient time if possibly remachining necessary be should. On the basis of a start in

November 2008, approximately transport would have to then take place to the launch site, with the following start preparations in August 2008.

All invited participants had to present the possibility their project in the detail and clarify further technical questions. Particularly it went thereby also around the individual interfaces to the satellite and other components or modules. Of the pin allocations of the individual plugs, up to which became respective signal levels, all aspects verified and the documentation if necessary updated.

Most important question naturally always in the end: When is the Flightmodul supplied?

Despite the taut schedule all module farmer very confidently within the next 2-3 months their modules were to be finished and delivered some participants could their flight hardware even already present.
In view of the hard time schedule, due to the locking of the ZEL's and omission of a part of the infrastructure already which can be foreseen, have also all took part the necessity and urgency this schedule strictly to keep accepted.

The status reports and further milestones the transponder farmer contributed however also too our zuversicht that the transponders will be available punctually.

Mirek Kasal OK?QK gave a detailed report over the conditions of the E07-Moduls, behind that the L-bands to receivers, the command detector and the Backup 5 MHz PLL Referenzoszillator hides itself.
All components are present already in airworthy version and it must the internal components with the plug connector at the module housing be only wired. With a noise figure of < 0.6dB and a passport volume of 150 kHz the receiver achieves outstanding values. The entire energy dissipation of the module of maximally 2 Watts was even scarcely fallen below with 1900mW. The l-Rx supplies the SDX, the self-service and Exciter, the x-volume transmitter (10,4 Ghz) of the P5-a transponder and the 24 GHz transmitters with a ZF signal on 10,7 MHz. Over the CAN DO module can be switched the Uplink by 1268 MHz (L1) to the Galileo alternative by 1263 MHz (L2).

Konrad Hupfer DJ1EE reported on the conditions of its high speed output stage components for the module E03 "Vs-Pa". The output stages are present already for

a long time in airworthy version and must be
integrated only into the module, together with the
HELAPS modulators, which are built in Marburg.

The v-volume output stage supplies a power output of
maximally 50-60 Watts on 2m with for instance
3-4mW input. With the used transistors it concerns
300W-Typen, so that sufficient security reserves
are present. The efficiency is with maximally 65%. The
self-service and output stage on 13cm produces
about 30-40 Watts of power output with 5-10mW control
and reaches an efficiency of 40%.
Konrad wants to use the time up to the integration,
in order to develop alternatively still another new PA
on basis of LDMOS transistors. This would have only
2-3% higher efficiency, but by omission of a -5V
supply
the structure would continue to simplify. The v-volume
output stage works already with LDMOS technology, so
that then also the HELAPS modulators would be
identical due to same operating voltage.

Michael Fletcher OH?UE and the OH team had their
entire prototypes for the linear/coherent P5-a
transponder thereby. The building of the flight
hardware began and the E05-Modul becomes punctual
now the order. In the SSPA mode Watts of HF at the
Highgain antenna are to approximately 3 at the
disposal. In the P5-a mode is sent at an Omni antenna
with 1mW achievement, in order transmit-strains
to Mars to simulate.
The x-volumes transponder can the pass band of L -, S
and C-volume convert, since appropriate ZF entrances
on the module are present. Likewise 400 Bit/s
telemetry in BPSK can be radiated. The P5-a
transponder is one of the largest challenges on P3-e
and with 9 different local oscillators and 21 mixers
with 13 different ZF frequencies of one of the most
complex transponders. All mixing oscillators are from
5 MHz reference of the USO fed and thus very
frequency-stably.

Howard G6LVB with an Omni antenna of Freddy ON6UG
Howard Long G6LVB and Steve Sanger VK6WN/M0CRX
gave information over the SDX and could still some
important details with the interfaces clarify.
The module E06 for the UV transponder contains the
u-volume receiver and the u-volume command detector,
as well as a CAN DO module beside the actual SDX also.
Steve Sanger has itself thank-worth-proves ready
explains the u-volume receiver of Oscar-13 to copy,

since this worked also several times in space and also radar-bright possesses. There were difficulties partly with the procurement of individual components, since hardly still on the market are to be found this partial. Other parts, as spools and filters could out of the AMSAT aMSAT-Fundus in the ZEL are taken. The software is already in large parts established and requires only fewer
adjustments and extensions. It will give several boatable Rome versions, which can be selected over appropriate control lines by the CAN DO module. The v-volumes transmitter and/or its HELAPS modulator by the SDX one addresses directly, i.e. by means of the phasensignals on 145 MHz and the envelope.

Additionally the SDX orders an ZF exit on 10,7 MHz for the self-service and Exciter and transmitter, as well as 10,7 MHz ZF an entrance of the L-band receiver. Like that are beside UV transponders also LV, LS and LS enterprise possible.
The SDX replaces the original analog transponder of William Leiyenaar PE1RAH and in particular was preferred because it makes additionally Leila and/or placing class-A operation possible. After the positive experiences with LEILA on Oscar-40, an enterprise would have been particularly with the UV transponder without LEILA hardly justifiablely and a backward step. The "achievement limit announcement" was a proven Tool around stations of excessive transmitting power to hold debited to the weak user. One called these stations also "crocodiles",
small ears and large.... Unfortunately however a LEILA module in conventional technology in P3-e could not be accommodated. The SDX offers now by means of the zukunfstraechtigen Southern German Broadcasting Corporation technology this possibility and still some more. Also the 400 Bit/s BPSK telemetry beacon by software in the SDX one generates.

Danny Orban ON?OD could participate unfortunately not personally in the meeting, could however by telephone still the current status of the E02 s-tx module, which self-service and Exciter, to communicate. The building of the flight hardware is fully under way and it insured a punctual supply.

Michael Kuhne DB6?T could not unfortunately participate for according to schedule reasons likewise, its k-tx and r-tx is however practical and Michael waits only for the CAN DO Flightmodule.

It looks less good with the C-volume receiver, probably is unfortunately available it up to the integration and does not have therefore to possibly be void. If one takes the optical volumes in addition, then it looks bad unfortunately
also for the two Arizona star cameras (module E1? and E14b). The work on the cameras is guessed/advised more in coming to a hold and the designers is in the meantime after conclusion of their examinations also not at the university of Arizona. Momentarily we strive here for a simple spare camera, which is attached directly to the SDX.

At present also the CAN DO prepare concern for us! Modules, which are needed for the controlling of the transponders and other satellite subsystems and large parts of the wiring harness by a CAN bus to replace. The modules are a common development of Amsat DL and Amsat well, whereby the production of the airworthy hardware should take place in the USA. Lately the drastically intensified ITAR export regulations of the USA makes more difficult the work to us at time unfortunately completely substantially, although these modules do not fall with exact view under this regulation. This problem the more still applies to the new IHU-3 on-board computer, whereby we are present here in the meantime a first functional self-reproduction to have and if necessary also must build the flight hardware here.

Freddy de Guchteneire ON6UG reported on the status of the different antennas and had also some samples thereby. In view of the somewhat eigensinnigen design it was not completely clear some participants with the combined 70cm/13cm-Omni-Antenne whether it concerns thereby approximately a gas lighter or a model of the Soyuz rocket (see further above).

Sunday was then used again intensively for co-ordination discussions and exchange of experience between all involved one. Well and with large zuversicht to deliver the modules in time made themselves then all participants gelaunt on the way home.

Last actualization (Sunday, 13 May 2007)

...OK Thomas, as I wrote in the bottom-line of my
Email, the translation is not mine (I have no idea
about German-language!).

It's from SYSTRAN Software.

Just I published that because the document is quite
large (and very interesting!!), in order to be able to
have a taste of this in English language.

"Don't shoot the.. pianist" !

73, Mak

PS: on the other hand - the "point" is that:
The plan for P3E-launch seems to be for the end of
2008 !
I will say 2009 for sure... Alleluia!

734. AMSAT-UK International Space Colloquium - Spies in the Sky

Yahoo group: eu-amsat
Date: 2007-07-01 10:57:37 UTC
From: Trevor
Topic: 734 Message: 734

AMSAT-UK International Space Colloquium 2007

Spies in the Sky: Surveillance Satellites in War and Peace

AMSAT-UK will be holding their 22nd International Space Colloquium at the University of Surrey, Guildford, England from Friday 20th to Sunday 22nd July.

The Colloquium keynote lecture will be given by Pat Norris, Chairman of the Royal Aeronautical Society Space Group, entitled "Spies in the Sky: Surveillance Satellites in War and Peace". Starting with Sputnik 1 and the impact of its launch 50 years ago both on the Soviets and on the West, Pat will discuss the social, economic and scientific benefits of satellites today in our daily lives some 50 years later. Pat is the author of a new book of the same name, which is due out in August.

His presentation will take place on Friday and will be followed by the SSC Research Poster Exhibition and SSTL satellite ground station tours.

The event is open to all. Either day passes or full packages comprising overnight accommodation and meals at the University are available. There is an online booking service for PayPal, Visa and Master Card payments.

The RSGB GB4FUN van will be present throughout the event to allow visitors to work the satellites. A Beginners Workshop will be held on Friday and an RSGB bookstall will be available on Saturday morning.

The event is open to all, for further details see
http://www.uk.amsat.org/Colloquium/

AMSAT-UK publish a quarterly newsletter OSCAR News. For membership information contact the secretary Jim Heck G3WGM

735. July AO-51 schedule up

Yahoo group: eu-amsat
Date: 2007-07-02 00:26:19 UTC
From: Andrew Glasbrenner
Topic: 735 Message: 735

The July schedule has been posted at
http://www.amsat.org/amsat-new/echo/CTNews.php .

July 2007 AO-51 (AMSAT Echo) Schedule

July 1 until July 31, subject to modification

July 1 - July 9
FM Repeater, V/U
Uplink: 145.920 MHz FM, NO PL Tone
Downlink: 435.300 MHz FM
9k6 Digital, V/U, Telemetry Only
Downlink: 435.150 MHz FM, 9k6 Telemetry

July 10 - July 12
FM Repeater, L/S
Uplink: 1268.700 MHz FM, NO PL Tone
Downlink: 2401.200 MHz FM

July 13 - July 23
FM Repeater, V/U
Uplink: 145.920 MHz FM, NO PL Tone
Downlink: 435.300 MHz FM
9k6 Digital, V/U, Telemetry Only
Downlink: 435.150 MHz FM, 9k6 Telemetry

July 24 - July 26
SSB/FM Repeater, V/U
Uplink: 145.880 MHz USB
Downlink: 435.300 MHz FM

July 27 - July 31
FM Repeater, V/U
Uplink: 145.920 MHz FM, NO PL Tone
Downlink: 435.300 MHz FM
9k6 Digital, V/U, Telemetry Only
Downlink: 435.150 MHz FM, 9k6 Telemetry

We had several requests for normal V/U repeater mode for various operating demonstrations and grid expeditions, but we also managed to fit in a few other modes in between the requested V/U dates. We do have one special request. During the SSB/FM cross-mode repeater July 24-26, please restrict your uplink power to reasonable levels. Last time there were some issues with very strong stations causing distortion on the downlink.

73 and enjoy,
Drew KO4MA

AMSAT-NA VP of Operations

738. RSGB Microwave Manager to Attend International Space Colloquium

Yahoo group: eu-amsat
Date: 2007-07-08 22:02:32 UTC
From: Trevor
Topic: 738 Message: 738

?The Future of Amateur Satellite Spectrum?

AMSAT-UK will be holding their 22nd International Space Colloquium at the University of Surrey, Guildford, England from Friday 20th until Sunday 22nd July.

There are no Primary Amateur Satellite allocations between 146 MHz and 24 GHz. The Microwave Amateur Satellite allocations are only Secondary. This means they suffer significant interference from other users including WiFi, TV Senders, Galileo, Bluetooth, Zigbee and WIMAX.

Additionally the existing microwave satellite segments are nowhere near the areas used for weak signal terrestrial operation. This is undesirable in that it can be problematic to construct equipment that can be used for both terrestrial and satellite microwave operation.

The lack of interference free microwave allocations is matter of great concern to the Amateur Satellite community so the presentation by the Radio Society of Great Britain (RSGB) Microwave Manager Murray Niman G6JYB on ?The Future of Amateur Satellite Spectrum? is sure to be received with great interest.

On Saturday morning there will be a talk on the ESEO satellite. This is a satellite built by students from across Europe. AMSAT-UK members are building a 435 to 2400 MHz linear transponder for the satellite.

The RSGB GB4FUN van will be present throughout the event to allow visitors to work the satellites and an RSGB bookstall will be available on Saturday morning.

On Friday there will be a special "Beginners Workshop" to show newcomers how to use the many Amateur Satellites that are available.

The event is open to all Amateurs and SWL's. Either day passes or full packages comprising overnight accommodation and meals at the University are available. An online booking service is available for PayPal, Visa and Master Card payments. Late bookings are still being accepted.

739. European Satellites at AMSAT-UK Colloquium

Yahoo group: eu-amsat
Date: 2007-07-09 12:25:19 UTC
From: Trevor
Topic: 739 Message: 739

On Saturday 21st July will be presentations on several new European Satellites at the AMSAT-UK International Space Colloquium.

P3-E / P5-A by Peter Guelzow, DB2OS

Danish AMSAT-OZ Satellite by Ib Christoffersen, OZ1MY

Delphi-C3 Communications Subsystem by Wouter Jan Ubbels, PE4WJ

ESEO satellite by Graham Shirville G3VZV

William Leijenaar, PE1RAH, built a Mode B (435/145) linear transponder for the Indian HAMSAT and he will be giving a presentation on Saturday afternoon.

The AMSAT-UK International Space Colloquium will be held at at the University of Surrey, Guildford, England from Friday 20th until Sunday 22nd July.

The event is open to all Amateurs and SWL's. Either day passes or full packages comprising overnight accommodation and meals at the University are available. An online booking service is available for PayPal, Visa and Master Card payments.

..it should be very nice, if this presentation
will be recorded into a DVD or VCD. For many of us,
it's quite difficult to participate this event, but on
the other
hand it is very interesting and personally I would
like to have a look later, even through a CD.

Hi Murray,

very interesting your Email and congrat's for QSO
and TLM capturing.

The decoder program for AO-7 is here:

http://www.qsl.net/k3tz/files/K3TZ_AO-07_Telemetry_Decoder_0.5.zip

...however, AO-7 is running without batteries and
(probably) the captured data are not enough accurate
for decoding and studying.

For example, I worked few mins ago the K3TZ decoder
with your data, but no sense at all. On the other hand
is obvious that, the CWGet (probably?) has lost some
digits, because the complete-correct TLM-data
including a "Hi HI" and six lines.

Each one line including 4 triads with digits.

That is not true into your captured TLM. I can't say
if the AO-7 sent missing data or the CwGet has lost
some letters or lines.

Anyway, congrat's again for your nice trying and
thanks for your sharing with us.

73, Mak SV1BSX

PS: pse correct your entry with VK6AKI, into Emily's
AO-7 Online-LOGbook.
Your LOCator is missing. Tks.

743. AO-7 telemetry.

Yahoo group: eu-amsat
Date: 2007-07-21 00:39:36 UTC
From: John Hackett
Topic: 743 Message: 743

Mak & Murrey,
For the telemetry on AO-7 to be valid the parameters
MUST read 649, 650 or 651.
Otherwise the telemetry is meaningless garbage !!!.

A full explanation follows ...

Telemetry received may be good or bad. You can determine if the telemetry is good by the 6D value. It is the reference voltage for the analog TLM system and it should be around 50. If not, then the remainder of the telemetry will be incorrect. Jan King, W3GEY notes that AO-7 had (has?) a very sensitive receiver and a good uplink antenna. 5 watts EIRP should provide a good downlink. Amplifiers are not required for the uplink. Excessive uplink power may be cause FMing of the transponder and may be causing the input voltage to the regulator that provides 6D to fluctuate causing all telemetry to be bad. AO-7 is almost certainly running only off the solar panels. It is very likely to be on only when in the sun and off in eclipse. Since it is resetting each orbit it may not come on every time. Reports of hearing the beacon just as it comes out of eclipse would be particularly interesting.

1. Speculation that long term chemical changes in one or more battery cells have led to increased cell resistance enabling the spacecraft to operate while in sunlight are correct and

2. Reports indicating that beacons, telemetry systems, and possibly transponders are operating

Then

The prognosis for long term spacecraft operation are excellent.

Channel Measured Parameter Measurement Range Calibration Equation
(Preliminary)
1A Total Solar Array Current 0 to 3000 ma I = 29.5 N (ma)
1B +X Solar Panel Current 0 to 2000 ma I = 1970 - 20N (ma)
1C -X Solar Panel Current 0 to 2000 ma I = 1970 - 20N (ma)
1D +Y Solar Panel Current 0 to 2000 ma I = 1970 - 20N (ma)
2A -Y Solar Panel Current 0 to 2000 ma I = 1970 - 20N (ma)
2B RF Power Out 70cm/2m 0 to 8 watts P = 8(1 - 0.01N)^2 (watts)
2C 24 Hour Clock Time 0 to 1440 min. t = 15.16N (min)
2D Battery Charge/Discharge -2000 to 2000 ma I = 40(N - 50) (ma)
3A Battery Voltage 6.4 to 16.4 V V = 0.1N + 6.4 (volts)
3B Half-Battery Voltage 0 to 10 V V = 0.10N (volts)
3C Bat. Chg. Reg. #1 0 to 15 V V = 0.15N (volts)
3D Battery Temperature -30 to +50 deg. C T = 95.8 - 1.48N (deg. C)
4A Baseplate Temperature -30 to +50 deg. C T = 95.8 - 1.48N (deg. C)
4B PA Temp. 2m/10m -30 to +50 deg. C T = 95.8 - 1.48N (deg. C)

4C +X Facet Temp. -30 to +50 deg. C T = 95.8 - 1.48N (deg. C)
4D +Z Facet Temp. -30 to +50 deg. C T = 95.8 - 1.48N (deg. C)
5A PA Temp. 70cm/2m -30 to +50 deg. C T = 95.8 - 1.48N (deg. C)
5B PA Emit. Current 2m/10m 0 to 1167 ma I = 11.67N (ma)
5C Module Temp. 70cm/2m -30 to +50 deg. C T = 95.8 - 1.48N (deg. C)
5D Instrument Sw. Regulator Input Current 0 to 93 ma I = 11 + 0.82N (ma)
6A RF Power Out 2m/10m 0 to 10,000 mw P = (N^2)/1.56 (mw)
6B RF Power Out 70 cm 0 to 1,000 mw P = 0.1(N^2) + 35 (mw)
6C RF Power Out 13 cm 0 to 100 mw P = 0.041(N^2) (mw)
6D Midrange Telemetry Calibration 0.500 V V = 0.01N(0.50 +/- 0.01) (V)

AO-7 telemetry format:

1aa 1bb 1cc 1dd
2aa 2bb 2cc 2dd
3aa 3bb 3cc 3dd
4aa 4bb 4cc 4dd
5aa 5bb 5cc 5dd
6aa 6bb 6cc 6dd
Hi Hi

Then these data are valid *ONLY* when 6D is one of 649, 650 and 651.

As you know, Jan King built AO-7 so he is the *MAIN* authority on this satellite.
I have been collecting AO-7 information for more years than I can remember.

.....

John,

You must be a lot of fun to be around. I appreciate your sense of humor.

Sorry fresh out of $1000 notes but,... I do have theories.

When the beacon is in a carrier mode it may mean that the voltage has gone low
again (who knows why: a user hits the uplink too hard a negative current budget
because of a bad sun angle) and when that occurs some logic states could change.
The beacon has several modulation sources. Apparently the RTTY telemetry
encoder was determined to have failed (during the long AO-7 sleep) and if that
unit was selected by the logic (randomly) to modulate the transmitter, then that
might produce a tone. The other thing I could imagine that could cause this
would be the Codestore module. What if that were connected to the trasnsmitter.
That should send morse messages if the memory were loaded but, who knows what's

in the memory and it could be all "1s" by now, especially if the memory was radiation damaged. Those memory chips (if you want to call them that) were not
RCA CMOS devices. They were from a small company and I can't remember who anymore. So, they may not have been as radiation tolerent as the rest of the
spacecraft. Anyway, if either of these two sources were selected it could be
that if the input to the transmitter is "high" that only a carrier would be generated. The fuzziness is interesting and would require some further thought.
All of it probably goes to the fact that there is very little voltage requlation
left now and whatever there is may be severely taxed by the wild swings of input
voltage from the arrays.

The transponders are a different matter but, the wobblyness and the squawks may
also be voltage regulation driven. There are certainly quite a few mixers in
each transponder. Any one of these has an oscillator and if that oscillator is
trying to operate in a voltage starved mode the voltage may begin to modulate
the oscillator and that, in turn, may modulate the output of the mixer stage (but, of course, on a different frequency). If the voltage is high enough for
all of the mixers in the transponder then probaby the system will faithfully translate a user's uplink carrier to the correct downlink frequency. If the voltage is lower then is required for the most stringent of the mixers in the
system, then we get squawks and wobbly carriers being transponded or maybe the
mixer output level drops so much that the effective gain of the mixer (these are
all active mixers, by the way) is way too low and the transponded signals just
don't drive the subsequent stages of the trasponder hard enough and we hear nothing.

Now, why would the voltages be low? One theory is that the solar arrays, which
were old technology back when AO-7 was launched in 1974, are also badly radiation damaged and just don't put out very much power. Another theory could
be that the battery is more of a load resistor than a capacitor these days (it's
certainly some of both) and that this is sucking power away. (We may have enough telemetry to sort this theory out, by the way). Also many of the loads on

the regulated or unregulated voltage buses may have increased current drain due
to radiation. There is certainly some of that going on too. If users hit the
trasponder uplink too hard, that will certainly mean the trasponder has to
source more RF power than it can get DC from the arrays and that will suck the
voltage down for sure. The one argument that would be hard for me to accept is
bad sun angles. At this time of year, the plane of the orbit must be very close
to perpendicular to the Earth-Sun line. We also know from other spacecraft
(like the MicroSats) that the magnetic stabilization system works very well and
the spacecraft pitches over pretty much in the orbit plane as it rotates twice
per orbit due to the perminant magnet on-board. There are no solar cells on the
top and bottom of AO-7 but, if the orbit were fairly perpendicular to the
Earth-Sun line then those surfaces would not ever see the sun and only the side
panels would be illuminated and that's just what we want. We also know from the
old days when we had good telemetry that the spacecraft rotates about its axis
of symmetry (the Z-axis) once every 13 minutes or so. So, that means each of
the side solar panels will be exercised and even if we completely lost one of
these panels it would not be a major factor in the power budget as it now
stands. So, I think it comes down to not much solar array output and some loads
that suck up more power than they used to. The telemetry for both RF power
output channels of both transponders seem to be working OK and they both seem to
have something like 1/4 of the RF out that they used to. So, that's a 6 dB hit
on the link budget and that's quite noticeable. One thing people could do to
compare the peformance to the old days is to put up a carrier of a known EIRP
and measure (with a spectrum analyzer or a calibrated receiver) what the
downlink power is. Now, assuming there was only 1 signal in the passband (which
may happen these days) then from that we can do a link analysis and see all
sorts of interesting things.

One last question, is there any evidence of the AGC working? There are some
interesting tests we could run with two stations and a spectrum analyzer. Lots

of fun could be had trying to see how our old friend is doing up there. If only
that thing could talk, it could tell us some really amazing stories, I'm sure.

73's,
Jan W3GEY/VK4GEY

To those whom it may concern,
The AO-7 log has been getting
"sloppy" of late.

<http://www.planetemily.com/ao7/ao7log.php>

Therefore I have decided from today, the 25th of July 2007, I will continue
to administer and edit the log for the convenience of the regular users.

Please remember ... it is designed to be an "activity" log ... not !!! a log
to see who can collect the most points so please refrain from entering
multiple QSO's on different lines for the same orbit ... because this will
then give false overall results.

Just follow the examples of K3SZH or G1WPR. If you do make a mistake, please
correct it by clicking on the hourglass to edit your entry. You can edit
your own entry but not other people's.

If you need anything other than your own entry edited, you can either use
the online contact form or e-mail me direct.

747. Faith restored.

Yahoo group: eu-amsat
Date: 2007-07-28 16:35:57 UTC
From: John Hackett
Topic: 747 Message: 747

Hello Al & group,
For the last few weeks I've been doubting my
equipment, aerial expertees and
satellite ability in general. However ... this afternoon (17:45z) my faith
was restored ... or "restorated" as Seagate Sally would say.

I am of course referring to the signal strength of AO-7.

This avvo', I damn near blew my own head off with the FT-790 (100mW) +
Telenor RS4000 (20w)
modified mobile phone base station amp at the blunt end and 10w at the sharp
end (100w EIRP from the array).

PTP.

(Points to ponder) Horizontally the downlink was THUNDERING !!!! in ...
vertically nowt !!! ... sod all, literally silence !!!!!! ... now, in 39
years of operating I've *NEVER* experienced that before and would have said
that it was an IMPOSSIBLE !!!! circumstance ... logic says there MUST !!!!
be SOMETHING !!!! propagated in the 90 degree sense.

Here, I must mention that I can switch between polarisation sense in
milliseconds !!! so *delay* was not an issue.

Oyez!, oyez! ... (like the town crier clanging his bell) ... I am sorely
amazed.

Got any (logical) explanations ??.

The other PTP ... the 2m preamp over Europe did make a *SLIGHT* difference
but absolutely no difference whatsoever !!! when AO-7 was over Wisconsin ...
which of course is the exact opposite !!
to what should be expected.

CURIOUSER AND CURIOUSER ... (The Cheshire Cat in "Alice in Wonderland" by
Lewis Carroll).

It all comes down to 3 words ... 1) propagation, 2) propagation and 3)
propagation.

73 John. <la2qaa@...>

748. AO-7 log.

Yahoo group: eu-amsat
Date: 2007-07-30 11:02:08 UTC
From: John Hackett
Topic: 724 Message: 748

Hello Group,
Regarding the AO-7 Resource Page log.

I was asked what I meant by my earlier remark of "sloppy". Please allow me to explain.

I think we all agree that for 'data' to be valid and meaningful it has to be 'entered' correctly.
If not, the results will give a false picture.

An example:

30th-July-07 at 09:05 on orbit 49661 station ****** worked station ******

AO-7 on orbit 49661 at 09:05 was in fact over Antarctica so neither ****** nor ****** were in
the footprint of AO-7.

Therefore, the actual QSO would be valid but the timing would be way off ... thereby giving a false overall impression.

It is not expected that one logs the 'exact' time of each contact since it is possible to work several stations on the same pass ... each to be entered on the same line ... but it would be advantagous
if stations would log their contacts with the correct data.

It's perfectly OK to log the contacts 'later' if you're busy ... but please do enter the data correctly.

If you make a mistake, you can edit your entry by clicking on the hourglass to edit it.

Thank you.

73 John. <la2qaa@...> AO-7 Resource Page Admin:

> to edit it.
>
> Thank you.
>
> 73 John. <la2qaa@...> AO-7 Resource Page
> Admin:
>

....several times, it is not possible to EDIT your entry(ies) and usually some operators they have used to say:

-"I can not edit my entry, I don't know why"

Well, in order to be able to EDIT your entry it is ABSOLUTELY NECESSARY to be "checked" the "REMEMBER ME NEXT TIME".

If you still wordering where is that, it's a "check-point" in the "right-down" corner, into "ENTER Contact" field.

If you have NOT ckecked this, the system does not allow to edit your previous entry(ies).
It's also necessary your PC-system to accept "Cookies".

Just keep in mind.

From: John Hackett
Topic: 750 Message: 750

To the group,
For those complaining of little satellite activity.

On Monday the 30-07-07 ... on AO-7 there were 12 different prefixes logged including several
Stateside - Europe contacts.

The prefixes were ... (in random order) ...

K9, G1, DM, F3, EA, LA, UA0, RA3, GJ, I6, HA, OH.

The Stateside stations were ...

K3SZH, N5AFV, K9QHO, K9CIS, K9HF, W7AIT, WA6KYR.

Now I know who Jimmie Hendrix was referring to ... Hey Joe ... (K3SZH).

751. AO-7 report.

Yahoo group: eu-amsat
Date: 2007-07-31 11:32:03 UTC
From: John Hackett
Topic: 495 Message: 751

A study of the AO-7 eclipse charts for the last 3 years shows a progression toward non-elipse orbits in late 2007 - 2008.

In effect, this means that AO-7 in all probability will not change mode unless anything untoward happens.

It also means that we appear to have a permanent mode-B LEO linear transponder for the forseeable future ... providing operators follow the recommended operating proceedure.

Please *do* decrease your power as the satellite approaches TCA to avaoid FM'ing.

This not only helps the satellite, it helps the other operators in the passband.

Don't be fooled by propagation anomolies. The mode-B transponder is working well and will continue to do so providing the alligators go and play somewhere else. Under normal circumstances you do NOT !! need a lot of power. Please use only the necessary to maintain adequate communications. If you can't copy people adequately, you should improve your receiving capabilities rather than increasing your uplink power ... remember, aluminium is cheap and it's a lot more user friendly to everyone concerned .... with perhaps the exception of your neighbours.

For all intents and purposes, AO-7 is a QRP satellite. Please treat it as such.

73 John. <la2qaa@...>

Just to add up John CW stations on transponders are used mainly by those who cannot heir their phone signal. They a often putting so much power that they literally killed AO-7. The few time i was on AO-7 i was able to reduced the power a 0 on my FT-847 and i was still able to hear my downlink quite well.

It is not an exact science but the less signal we can used its the best. CW operators if you are using this mode as it is the only way to work on satellite beware and watch your signal you probably using way much too power than you should.

I don't know if many will read this as on this side of the pound many are on "other mail reflectors"... and as they censored now what they want to hear i doubt the same message will go through :) They called this speech freedom!!!

Hi Luc,
You're absolutely right ... and let me say, I followed the
'flaming' on the Amsat-bb.

No matter what some of those babboons might say you're *ALWAYS* !!!! welcome
on the
EU-Amsat reflector ... where everybody has the right to an opinion without
being criticised.

The only criteria being ... an amateur radio callsign and an interest in
amateur satellites.

Have good day Luc.

73 John.

Hello Luc

The CW-OPs who "kill" AO-7 are no satellite operators. Don't forget, AO-7
is listening in the wrong frequency range at 432 MHz. That's the problem.

Every time this has happened in the past, several times over the past few years, the 24hr timer has activated, switching between A and B. There is no reason to expect it won't again.

73, Drew KO4MA

?

A study of the AO-7 eclipse charts for the last 3 years shows a progression toward non-elipse orbits in late 2007 - 2008.

In effect, this means that AO-7 in all probability will not change mode unless anything untoward happens.

It also means that we appear to have a permanent mode-B LEO linear transponder for the forseeable future ... providing operators follow the recommended operating proceedure.

Please *do* decrease your power as the satellite approaches TCA to avaoid FM'ing.

This not only helps the satellite, it helps the other operators in the passband.

Don't be fooled by propagation anomolies. The mode-B transponder is working well and will continue to do so providing the alligators go and play somewhere else. Under normal circumstances you do NOT !! need a lot of power. Please use only the necessary to maintain adequate communications. If you can't copy people adequately, you should improve your receiving capabilities rather than increasing your uplink power ... remember, aluminium is cheap and it's a lot more user friendly to everyone concerned .... with perhaps the exception of your neighbours.

For all intents and purposes, AO-7 is a QRP satellite. Please treat it as such.

756. Satellites photos?

Yahoo group: eu-amsat
Date: 2007-07-31 16:42:52 UTC
From: SV1BSX
Topic: 756 Message: 756

Hello to Group,

the last month we had a wide-area disaster in
my country (and all over South Europe, like Italy,
Bulgaria, Albania, FYROM, Turkey etc)
from fired forests. And probably you are remember
a similar disaster the previous year in Portugal.

These high temperatures (45 C in Greece), it should
be not an exotic effect in the future, but probably a
usual weather condition during summer months for the
next years due to "greenhouse effect".

For further analysis of wooden-areas on my country,
I wondering if it is possible to take some fotos from
Satellites, in order to have an image of disaster
areas, for future use and comparison.

Have we Satellites in "public use" for this? Is it
possible an amateur radio operator to take Satellite
photos from Earth-areas, like Weather-Sats, but with
much-much better analysis in order to use these fotos
for observation about the forest progress in the near
and far future?

Thanks

73, Mak SV1BSX

Drew,
It is my understanding from recent correspondance with W3GEY/VK3GEY
Jan King ...
(Jan 'built' AO-7) ... and earlier correspondence with N1JEZ Mike Seguin
(AO-7 control operator) when I first posted the mail re: the timer last year
.... that the timer is completely random when the satellite comes out of
eclipse and since there are no imminent occurances of eclipse as far as I
can see, I assume the mode will not change unless anything 'ontoward' occurs
to upset the electronics.

High power *can* affect how the control systems behave ... (obviously, I'm
not going to mention the command parameters or the power required).

If my assumption is wrong, I stand corrected. In either case, listening to
the regular operators will confirm the mode.

The mode changes can be viewed at ...
<http://www.planetemily.com/ao7/stats2.php>

The predected eclipse chart at ...
<http://www.planetemily.com/ao7/Eclipse.php>

Perhaps other operators will obtain different conclusions from the above
predictions.

Opinions are are invited.

That is, after all, precisely why we started the EU-Amsat reflector.

I CC'd this mail to the amsat-bb since the number of Stateside users has
increased in the last 2 months and this information may be of interest to
them too.

Topic: 495 Message: 759

I think I may have misunderstood what you originally wrote. During the two previous periods of constant illumination, one in 06, and one in 07, the timer changed the mode every 24 hours with surprising regularity. You can examine the reports from March of 07 on the log page to verify this. I, and I think others, took your original message to mean the opposite, i.e. the mode was frozen during constant illumination periods.

I would tend to disagree about the randomness of the mode as it comes out of eclipse though. It seems to much favor Mode B over A, although this may be skewed by the numbers of ops reporting each mode.

I certainly agree with the comments about watching the uplink power, although over the US we have problems with 432 propagation beacons and terrestrial users overpowering the uplink on occasion. It took me an embarassingly long time to realize who these guys were on LSB on the downlink!

I thouroughly enjoy the old girl, almost as much as I did FO-20 and the later days of AO-10 when working into EU.

Topic: 495 Message: 760

Drew,
I think we're in agreement, though of course it's difficult to be positive re: AO-7 with so many variables that could affect things and like Jan says (tongue in cheek) his memory isn't what it used to be. He did tell me some funny stories about the construction and testing in his garage !! .... while minding a new born baby ... (hope Misses KIing isn't reading this).

I did manage to find out that the article in the December 1974 newsletter contained information that was *NOT* correct ... (re: components of the timer) ... this is detailed in Observations ... <http://www.observations.biz/> ... but I can recall exactly where I put it because my memory is down to a single acvtive braincell these days.

I'm pleased to see we have something in common re: the satellites. FO-20 was my all time favourite
(Japan - Norway on a LEO) ... followed by QRP'ing on AO-13 with a home brew station, RS-10 and AO-10 were also favourites.

(I once worked all the way into Finland !!!! on AO-10) ... he he he.

My current rigs are both well over 20 years old so it was quite a challenge seting them up for fully automated doppler and tracking ... though of course I still do everything manually on AO-7.

Due to the low orbit, automated operation is an advantage on VO-52, particularly when operating CW while eating the obligatory apple ... (an old Royal Signals trick) ... but of course it's by no means a 'necessity'.

Hi

I was just playing around with Skype and just want to test and try their Skypecast feature. I start one named "AMSAT WORLD" you have only to go on this skypecast enter in and i will have to enter you in the list.

It is not related to any official AMSAT group but could be a way to let your friends know when a pass is going AOS at your QTH.

Feel free to use it at will just go by Skype rules.

BTW You have to install the program very straightforward. I just use it 2 weeks ago to make a lot of "free" phone calls from Florida to my friends and family here in Canada. computer to computer contact are free you have to pay about 17usd to get on year of all North American unlimited call access. Could be same special deals are in force elsewhere skype originated in UK.

Cannot promise 24/7 access but will try to see if this is an asset and not too time consuming.

Another lonely mid Atlantic South to North pass :0(

Perhaps next time.

Cheers,

Dave.
Portland. Dorset. IO80SM.
AMSAT 5766

It will be useful to know what kind of TX power the sat use on the different
mode. Many can put up antennas with more or less gain depending of sat TX erp
power.

For testing purpose EIRP is important to be able to check if the budget power
calcs are working or not as well our wires and rods???

I was listening on many pass testing probably the wrong S band antenna! It will
be also helpful to have a log system where we can see what the others are
doing. It helps me when i was a newbie could be it can help other too?

I know the operating side is not as much valuable as other sides but i cross
posted this one to Eu-amsat@yahoogroups.com... Fearing the great evil!!!

Hello Kevin, Roger,
Kevin, I'm glad you dug out one of my earlier
posts re: the timer issue.

(Roger, I'm the chappie the >>>>'s are referring to in the following post).

<http://www.amsat.org/amsat/archive/amsat-bb/200601/msg00455.html>

Like I already mentioned ... and Kevin repeats ... it's no big deal, lets
just wait and see.

If I'm wrong, I'm wrong, no harm done. Lets not waste anymore bandwidth on
it ok? ...
however, Roger, it would be impolite of me not to answer you questions.

>I would love to hear your version of what will happen when there is a lack
>of eclipse for the satellite

As I previously mentioned, I would expect the satellite to remain in the
mode it was in as it came out of eclipse. As I also mentioned, I would stand
corrected if that doesn't happen ... ie ... it is
not !!! a big deal and if I'm wrong ... I'm wrong ... no harm done.

Please note that I am *NOT* the first AO-7 operator to come to this
conclusion.

>Are you saying AO-7 went up without a timer?

No ... I'm not saying that, I am saying that the designer and constructor of
the apparatus in question told me that the components used were not as
stated in the 1974 newsletter.

<Are you saying the timer is no longer functioning?

I have said earlier and am saying now !!! ... that the timer functions
PERIODICALLY ... as can be seen by the entries in the log for the last 3
years ... (monitored by myself).

Perhaps a re-read of my original mail might be of value here?.

The intent ... to make a simple observation for the benefit of those who
don't necessarily follow the daily "doings" of AO-7 like I do.

Nothing more - nothing less. No form of criticism to anybody or anything
offered or implied.

>how is it you determined that the timer is no longer "in the mix?"

By monitoring the satellite daily for the last 3 years.

>If AO-7 comes out it's "final" eclipse in Mode A, will it stay there?.

Who knows !!! ... I certainly don't. I think the real experts all agree ... it *random* ... the reasons are many and varied ... *NOT* just temerature and age.

CC'd to interested parties.

73 John. <la2qaa@...> AO-7 Resource Page Admin:

Hello Roger,
Here's a link to the estimated eclipse times through to
2008.

<http://www.planetemily.com/ao7/Eclipse.php>

Also, the seasonal statistics of AO-7.

<http://www.planetemily.com/ao7/stats2.php>

If you backpeddle you'll see that mode-B becomes more predominet as the
years go by ... the main parameter being sunlight.

checkig this against the estimated eclipse times will land you in the same
part of the ballpark I took my original estimations from ... but please do
!!! remember, it's all "logical' speculation.

There are so many variables. Even some clown with too much power could upset
the voltage threshhold ... they might even succeed in turning the old girl
off altogether !!! ... hence the enforced tight-lippedness re: power and
commands etc.

I can tell you though, I know what you mean about mode-A.

Though I'm a so-called "experienced" ... (note the hyphens !!!) ...operator,
I truly miss the challenge of chasing RS-10 across the sky while manually
adjusting for doppler. It had an excellent !! receiver,
an acceptible transmitter, the Robot was novel and there was plenty of SSB
and plenty of SSB and plenty of CW to keep everybody happy.

It rather surprised me that after P3D Amsat chose to promote an FM satellite
in LEO, thereby limiting the the number of users per pass dramatically ...
but that debate has been driven into the ground already.

The Europeans and Americans have differing views on this as seen by the mass
exodus of members from Amsat-UK when it became known that Amsat-UK would
provide substantial funding for an FM satellite.

Many years ago, when my good friend Russel Tillman was editor of The Amsat
Journal he explained the policy making ... "we have to keep the constructors
happy" etc ... so as a mere operator, whether you help to fund things or
not, you get what you are given, take it or leave it.

You may ... (or may not) ... find this link amusing ...

Hi John & group,

personally I agree 100% with you John. AO-7 this
summer working like a "single" Mode-B Satellite !
This is very unusual comparing with previous years,
where during the summer-months it was mainly "ON" in
Mode-A. And I know that very well, as a "fan" of
Mode-A.
But definitely, this summer-period something is
different on satellite's behavior .

I wondering before several weeks, why the Satellite
was not "ON" on Mode-A, but nothing more.
John LA2QAA has an "eagle eye", so not just he noticed
that but he wrote it, wondering also about the
possible ralationship with "Timer's" operation , when
the AO-7 will going out of eclipse the next months.
Good one John.

So, I can't understand why all this
"noise" from some others friends. If somebody watching
the "old grand lady", it's obvious that something is
changed.

73, Mak SV1BSX

Hello Mak,
I appreciate your support and am very glad somebody else
noticed the discrepancy ...
and while I have the pen ... (keyboard) ... congratuations on your fine
signal on the old girl yesterday, the first time we've worked on AO-7.

Since we're both completely blocked by mountains in our respective take-off
directions we did OK Makis.

I told !!! you the EU-Amsat reflector would be a success didn't I ... we did
good Mak.

Hi Robert

Your second satellite contact QSL card is in the mail. Just before opening your letter i was under the impression this letter come from a french speaking guy! Robert Rousseau "Rousseau" is on many phone directory book here.

I put a note on the back of the card and i hope we can make another QSO on a HEO sat.

73

P.S. What about the diesel engine train car engine on your card? And i strongly recommend the AMSAT-NA readers to try your numerous test... It will help them a lot especially their BOD :) at the first one i score +- 10% on the average. I just planned to post me results... on my web page as honestly possible and i challenge the BOD members and candidates to do the same...;)

Like the next HEO we can always dream alive...

Hi Luc,

good question indeed... a possible scenario it could
be:

now both objects are in orbit by using natural
forces (these orbits are shown by Orbitron).

But the Shuttle has some rockets... and may be in the
right "timing" the Shuttle use them in order to follow
a different course for the "rendez vous" with ISS.
Additional, when the 2 objects are close enough,
the Shuttle needs very good manipulation for safety
docking. This operation definitely needs also enough
time (which is unknown to... Orbitron-software!)

Just my "2 cents" thought.

772. Fwd: FO-29 status, 7 Aug 2007

Yahoo group: eu-amsat
Date: 2007-08-10 11:12:06 UTC
From: SV1BSX
Topic: 772 Message: 772

From: Mineo Wakita <ei7m-wkt@...>
Date: Fri, 10 Aug 2007 19:25:38 +0900
Subject: FO-29 status, 7 Aug 2007

JARL report about FO-29 (Fuji-3) status and operation, 7 Aug 2007

The inside impedance of battery in FO-29 (Fuji-3) are rising now extremely by deterioration at time. According to the telemetry data and the eclipse rate of the satellite main body (the rate that a day is not), 25 minutes are supposed with a limit as for the analog battery system use. Because the eclipse rate of current FO-29 (Fuji-3) is about 30%, the power supply of the relay with the battery cannot serve a period of the eclipse.

And the malfunction occurs in the part of the electricity control system. The malfunction to become the problem in use in particular is UVC which is an automatic function about the electricity management. When the satellite is in the eclipse, and the light of the sun is not the solar battery, the transmitter becomes OFF by UVC. It is designed afterwards so that an analog system transmitter becomes ON automatically when the terminal voltages of the battery exceed the rated value after the light of the sun is the solar battery. However, it is likely that malfunction occurs for this function, and the terminal voltage cannot turn on a transmitter even if it exceed the rated value unless we send a command from the ground.

The eclipse rate of FO-29 (Fuji-3) will rise in future and rises to 34% in March 2008 and comes over a peak of the eclipse rate. When it goes over this peak, the eclipse rates decrease slowly, and it

is 20% in August 2009,
and it is all sunshine (the period when the sun
continues being) in
February 2010.

Because we follow for about 8 months, as for all
sunshine, it seems that
we can apply the analog system relay consecutively
for this period.

Did anyone is aware of any press release from NASA about NASA Astronaut Leroy Chiao. I just see him on CNN and they presented him as a "Former NASA astronaut"! On NASA bio web site
http://www.jsc.nasa.gov/Bios/htmlbios/chiao.html
the only one reference on his NASA present status is "Leroy Chiao (Ph.D.) NASA Astronaut (FORMER)?

If you come by any news reel or press agencies release as the Ed Lu press note just send me a copy of it.

774. FO-29 active over EU tomorrow !

Yahoo group: eu-amsat
Date: 2007-08-11 10:44:22 UTC
From: SV1BSX
Topic: 774 Message: 774

Hi folks,

as pointed out by Masa, JN1GKZ,(see message below)
tomorrow 12-8-2007 the FO-29 will be "active" between
04:30 - 05:14 Z .

This pass is a good opportunity for European stations
including overseas QSOs, as the apogee
of Satellite is maximum over Atlantic Ocean (1320 Km)
at 05:01Z.

AOS for N-E Europeans about 04.46 Z

LOS = 05.14Z, where FO-29 entering
in the eclipse and it will STOP.

I wish you good QSOs/FO-29.

776. AO-7 Booster-ON ?

Yahoo group: eu-amsat
Date: 2007-08-12 18:50:38 UTC
From: SV1BSX
Topic: 776 Message: 776

Hi all,

well, today afternoon AO-7 came from South.
I called CQ CQ on CW and my return-signal on DownLink
was good, about 559. Nothing unusual at this time.

Suddenly (~17:45z), my S-meter "jumped" to 9+20dB or
more (with my signal) and also the difference in
audio-strength was spectacular. Another point is
that, from this moment and till LOS the FMing was
terrible and it was impossible to hear clearly a
station which he answered me .

I wondering, what is it this effect?

Is it the Mode-B and in the previous time (where the
Downlink was lower) the Satellite was working in
Mode-C ???
Or something happens and seems like to fire-up a
Booster?

I am sure, you have similar experience with
"Grand Old Lady". It is not the first time where
this happened to me, I had the same experience also
3-4 times again, in the past... So, I would like to
hear your opinions about this effect.

Hello Mak and group

I had observed the beacon at this time. The signal was very strong.
About twelve minutes before LOS the "lady" flew into eclipse, but I
heard the beacon with the same strength as before for about 10 minutes
just before LOS. Very interesting, has anyone changed the batteries ?
;-)

Hello Thomas & Group,

I wonder if we mean the same pass, I'm talking for
yesterday 12-8-2007 and according to NOVA-software the
orbit number was #49.820.

If you mean the same pass it is strange but, as my
software shows the Satellite was in "full Sunshine"
during this orbit over the Europe and never into
eclipse, as you pointed out.

Precisely, the Satellite was in *eclipse* over South
pole till 17:16Z... at 17:17 Z entered into
"Sun-light" (over Madagascar) till 18:57 Z, where
again entered in the dark for a new eclipse-period.

I have checked my program and seems to be OK.

Can you check your Sat-tracking program please?
I notice a great discrepancy here between yours - and
my DATA.

779. AO-7 Status.

Yahoo group: eu-amsat
Date: 2007-08-13 07:42:18 UTC
From: John Hackett
Topic: 779 Message: 779

Hello Group.

The status of AO-7 on orbit 49836 07:17 UTC on Monday the 13th of August was, at my QTH, pretty much the same as it has been for the last 3 months.

The beacon is weak and warbling and continues to transmit invalid data due to the lack of adequate voltage.

Please continue to observe QRP practices.

Thank You.

73 John. <la2qqa@...>

You are right Mak, I mean the pass at Sunday evening.
But also on this pass the signals where unlikely strong,
also in eclipse. Normally in eclipse after sunlit I can
hear the beacon only for a few minutes before it goes
down.

Hello John and group

Look at orbit 49833 this evening for strong signals. It will be
interesting, if the signals would normalize to lower levels. I can
not listen this evening.

Hello all,

the semi-operation of FO-29 is good news, but unfortunately many of us we have not the chance to operate again the bird as these orbits are "out of range" and also very early morning for our locations.

So, I'm thinking if the JARL is possible to authorize a few additional Ground stations (1-2 operators)in Europe and USA, which they are very populated areas, in order to "trigger-ON" the bird.

For example, every afternoon the FO-29 has 2-3 nice ascending passes over Europe and then descending over USA, but the bird is silent. If someone can send a "trigger-ON" command to the Satellite before the European pass (ie when FO-29 comes from South of Europe), it will be active over Europe and USA as well till the next eclipse.

Just a thought...

Hi Luc & Group,

very interesting indeed this battery (except the
human blood!) and I agree with you:

always the problem on amateur satellites is from
battery.

Before several months I was wondering about the same
point and why the power sources on commercial
satellites are much more
reliable than amateur satellites. Then, I was thinking
the 2 Voyagers, they work in deep space without enough
Sunshine for 30 years (Voyager 1 launched at September
1977!)

How is that possible? well, these spacecrafts use
"nuclear batteries" !

I wondering if is possible to realizing that onto an
amateur satellite... can you imagine a HEO with
life-time for about 30 years?
Super-duper !

Have a look on Links:

http://www.msnbc.msn.com/id/7843868/

791. AO-7 LOG.

Yahoo group: eu-amsat
Date: 2007-08-18 10:15:58 UTC
From: John Hackett
Topic: 791 Message: 791

Gentlemen,
Once again, please be advised, The AO-7 Resource Page log
was primarily designed to be an *ACTIVITY* log ... It was *NOT* meant to be
a contest log.

It was designed for those of us who are genuinely interested in the welfare
of the satellite ... so we could see the *activity* on this bird ... *NOT*
to see who can amass the most number of "points".

Worst case scenario ...

There is one particular station who has amassed well over 100 points in the
last 3 months without having conducted one single QSO ... not !!! what the
log was intended for.

73 John. <la2qaa@...> AO-7 Resource Page Admin:

792. AO-7 log proposal.

Yahoo group: eu-amsat
Date: 2007-08-21 08:29:09 UTC
From: John Hackett
Topic: 792 Message: 792

To whom it may concern,
I propose that the statistics system of
the AO-7 Resource Page log be modified somewhat.

Namely ... that the scorecard *NOT* give points when no actual QSO takes
place.

Further ... that the minimum requirement should be an exchange of signal
report and locator for a
'valid' QSO to be added to the scorecard.

The reason that I propose this change is that one particular station has
claimed 34 points in the last 7 days without having conducted one single QSO
.... which makes a mockery of the current scorecard system.

While the log was originally intended as an ACTIVITY log ... there are many
stations who appreciate the scoring system ... thereby adding to the
'challenge' ... and increasing their awareness of the need for good
operating proceedures as well as improving their receiving capabilities.

It is unfair that these stations be surpassed by others who don't even have
a QSO via the satellite.

That is why I propose a modification of the scoring system ... ie ... no QSO
= no points.

Opinions, comments and 'flaming' to me please, preferably on the back of a
$100 note though an e-mail will suffice ... (at a pinch).

73 John. <la2qaa@...> AO-7 Resource Page Log Admin:

793. AO-51.

Yahoo group: eu-amsat
Date: 2007-08-21 12:24:32 UTC
From: John Hackett
Topic: 793 Message: 793

Hello folks,
Not having worked an FM satellite for about 10 years I'm
wondering if there's any activity over Europe on AO-51.

I've worked various analogue satellites every day for the last 17 years but
havn't listened to or worked AO-51 "live" ... though I have listened to it
while it was over California ... (while connected to N1DID
on Echolink).

I recently borrowed an IC-E91 D-Star handheld and thought of giving AO-51 a
try. My QTH on Frei Island doesn't lend itself to ISS passes but according
to InstantTRACK AO-51 does occasionally pass within spitting distance of me
.... but do the Europeans work this satellite?.

Any comments would be very much appreciated.

73 John. <la2qaa@...>

794. Re: [eu-amsat] AO-51.

Yahoo group: eu-amsat

From: SV1BSX
Topic: 793 Message: 794

Hi John,

well, AO-51 is very active over Europe and sometimes
seems to be like a "Zoo", with a lot of QRM.
I have several weeks to listen that, may be these
days is easier due to August vacation-period.

About D-Star, as I remember (but I'm not sure) AO-51
is not the best bird to try somebody the D-Star. They
have made some successful QSOs with this system via
AO-27 (yes, I know, AO-27 is OFF over your QTH).

So, try AO-51 as FM-bird. Just have a look on AO-51's
schedule:

http://www.amsat.org/amsat-new/echo/ControlTeam.php

These days working on LU-mode (1.3 GHz Uplink/UHF
Downlink), so you must borrow ...another RIG for
1.3GHz (he he he !).

On the other hand, you can just listening now
other amateurs on 435.150, in order to test your
receiving. AO-51 has a particularity, the carrier on
Downlink frequency is always ON -even if somebody
talking on the bird or NOT. This feature is good in
order to be able to find someone easily the center
Downlink and helps also the Doppler-correction (see
..rookies!).

After 27 August will be back again to VU mode
(145920 Up / 435300 Down).

Then, try a "shoot" against to the bird...
the Hunting-period for our V-U guns is "open" again
after 26 August !

Have fun!

Oh yes, John. Over the weekends it would be sounded like in an ape-house.
You remember my statement in this forum ? ;-) There are most Italian and
also Russian OMs and in between HB9SKA :-)

You can also try SO-50 with a 67 Hz CTCSS-subtone. And AO-27 in the
first half of the orbit until the packet beacon.

Welcome John to the FM-Sats.

Mak,
Thanks for your tips. Well as a dyed-in-the-wool QRP'er and experienced *tailender* ... it should be interesting trying to catch the echo ... (pun intentional) ... before everybody else ... (the capture effect) ... on the Turkey shoot ... he-he-he-he.

Several stations have warned me about the TOTAL chaos ... something GM1SXX and myself have been talking about since the plans first became apparent for another FM satellite.

Single channel FM may be suitabe for certain commercial applications but is *NOT* the best choice when there are several potential users ... for obvious !!! reasons .... well, obvious to everybody except Amsat maybe.

Thanks for the warning Mak, I can assure you ... I am aware of the limitations.

73 John.

Hello Thomas,
Well, I did work AO-27 soon after it was launched but
gave up due to the *TOTAL* chaos and inpracticle modulation mode for a
satellite with potentially several users within the range circle.

FM with it's capture effect promotes the *OPPOSITE* of good operating
proceedure for a satellite ... where one ought to take into account the
power buget etc ...

Amsat claim the FM sats are "EASYSATS" ... this may well be but they do
teach the worst possible practices to potential newcomers ... and therefore
are, unsuitable as "teachers".

That is my opinion anyway.

Thank you for taking the trouble to reply Thomas. Very much appreciated my
friend.

73 John

Hello Al,
Presumably you've also mentioned some of your comments to the man himself? ... beta testing, 20m version, *RIPPING* out a couple of toroids n' crystals ... (the latter being contributed by "the other half of the act").

I've had *MANY* replies to my AO-51 posts. In *EVERY* !!!! case the word "CHAOS" was mentioned so I think the GM1SXX/LA2QAA opinion of FM on an amateur satellite is justified.

Other words that were mentioned were ... ungentlemanly ... rubbish ... zoo .... bad operating practices ... (that !!!!! was a surprise).

Single user, capture effect ... hrm, FM is OK for certain commercial applications but quite unsuitable for the potential newcomer. Easysats? ... P?H !!! ... they teach the potential newcomer how *NOT* to operate a satellite ... (power budget, 100% duty cycle etc). With many users in the passband/range circle FM is *NOT* the mode I would recommend for a transponder ... but hey !!! ... that argument has had the excrement beaten out of it ... here, the 13 commandments apply ...

<http://www.observations.biz/Joint_Observations/the_thirteen_commandments.htm>

I'd also mentioned ... for the same price as AO-51 one could have had a mode A linear transponder on one satellite, a mode-B on another and a mode-J on a third ... using the RS model design AND STILL HAVE ENOUGH LEFT OVER FOR 2 x FISH SUPPERS. The *BIG* problem of course being the launches.

I re-lance my original idea from Observations in Oscar News anno 1995 ... a used knicker elastic campaign and a soddin: 'BIG* catapult ... but *DON'T* let the LA2QAA/GM1SXX team design it otherwise we'll probably end up with a few thousand pink and frillies orbiting the earth and a satellite still lying in the ground.

I fully agree with you John. I hope now, a few OMs who read this, would
operate with more discipline in future. Thank you, the fun will be greater.

800. AO-51.

Yahoo group: eu-amsat
Date: 2007-08-22 08:06:10 UTC
From: John Hackett
Topic: 793 Message: 800

Hello Folks,
Thanks to everyone who provided comments re: my AO-51 post,
very much appreciated.

This morning I had my first listen (and QSO) over Europe via this satellite.
The comment from one of
my friends yesterday ... "a zoo" ... was absolutely accurate.

It's a good job I was married to to a Russian.

(AO-51 rises over Russia in the mornings before gracing Frei Island with
it's presence).

The standard of operating was precisely !! as I'd expected and reinforces my
opinion that FM is a mode quite unsuitable for amateur satellite operating
where there are several potential users competing for access ... promoting
the ... "mine's bigger than yours!" ... syndrom. Someting we *SHOULDN'T* be
teaching the potential newcomer.

Once again, thanks for the help.

NB,

Perspnallu, I got far !!! more out of operating SV1*** on CW via AO-7 than I
did operating UA**** on FM via AO-51 ... but then again, I'm old, bald and
senile.

Hello John and forum

"Easy-Sat" is our problem. In Europe and Near East (ex Soviet) there
are too many operators with a 2m/70cm rig to operate a single channel
FM-Satellite. Without good receiving and discipline (Ooooooola cryers
and crocodiles), FM-Sat-operation can not function well.

In America the situation is an other. There the Sat-HAM-population
scatters more over the whole continent.

A solution can only be to switch on CTCSS for mode V/U again. Or to
teach discipline, but...

I'm glad to operate mode L/U over AO-51 during the weekand again.

Hello Al,
Smart !!! re: the offer of project testing.

If G*ALU is half as smart. he'll let you do it too. I hope he *is* that smart.

RGR on the tip re: the 2.5mm jack ... QSL.

QSL means: "I acknowledge receipt ... not !!! please send me a card ... though it *IS* the correct
code to use for acknowledgement of a QSO ... (as in QSL card).

OK !!! ... I know you know ... I'm just showing off my (mother) superior knowledge of the Q-codes but in the Sigs we used Royal Navy Z-codes more than Q-codes.

ZBF = prepare to receive a long message.

We "remembered" that one as ... ZBF = "Ze BIG Fu*ker" !!!.

I could write a book about the Sigs methods of "remembering" things.

A big fat hairy Yoeman of Signals (instructor) used to *dig* us in the ribs with his Pace stick to showed us how to "remember" the letter F ... dit-dit-dah-dit ... DID IT HURT YOU? ... we NEVER !!! forgot F.

Q = Here comes the bride ... dah-dah-dit-dah

V = Beethoven's 5th symphony ... dit-dit-dit-dah.

Learning CW can be fun !!! ... you eventually progress to putting a standard issue hand key on the floor and transmitting via a broom handle ... and wo-betide !!! that nasty little man who doesn't transmit 100% perfect morse.

At least it was fun when I became the instructor and did the "digging" ... he-he-he.

73 John.

QSL means that I acknowledge the information you just sent me...
With respect to the QSL card, most hams ask for that specifically.
However, after you have had a qso (conversation), with someone, you should
consider sending your qsl card to him, considering the cost of one stamp
per card, via the qsl bureau. Most times, when that person receives your
qsl card they will, in turn, send their card, to you, via the bureau....

To anyone concerned,
As I mentioned to Larry, I had already said
QSL ... for those who didn't understand the obvious, I can write the reply
in full ... (which defeats the object of Q & Z codes).

I acknowledge the fact that GM1SXX 'INFORMED' me he had sent me 1 x 2.5mm
jack plug.

Ergo ... 'QSL'.

(This post for those whom apparently like to nit-pick and/or fail to see the
obvious).

73 John.

The only one sat you missed is AO-40 the king pin of the whole amateur radio satellite but you are right about AO-51 on paper it was supposed to be an opener... but practice demonstrate that the theory is far for reality it is more a closer! Those who come from HF are generally disappointed as the QSO'S are: name here is XXX grid square XX34XX 59 your signal report and next name here is YYY and so on.

I think even if we can make AO-51 with an HT and a rubber duck i still think amateur satellite world is not suitable for QRP but HF is.

HEO is our salvation

As a long time active satellite operator starting with the days of A06 and up, and a 33 year AMSAT member, I have a question. What happened to progress? When A051 went up I thought and read that A051 was a stepping stone to the introduction of new members to satellite communication, to get on with simple and doable equipment. To feel the excitement of communicating via an orbiting satellite. However, members and non members are still falling over and qrming each other to get that elusive grid square or state, and that's fine. What happened to progress?

Yes, I remember my first satellite contact on A06 which was across the pond to G2RD using mostly homemade equipment. Even my wife celebrated my accomplishment with me. The stuff was not as available as today, or I couldn't afford some of it.

The fm sats dominate as far as activity. A07, V052 and F029 combined are not even close. Why have people not progressed to the other sats to get the feel, experience and hopefully improve their receiving skills. It will take that to be successful. I could work 49 states (Hawaii is a stretch for me on A07) in a week or less if people from the fm satellites would join us on these CW and SSB birds. That's how large the footprint is. Check out Emily's A07 Logger. There are many more EU stations then on the US side.

Since A07 has come back from its long sleep it kept my interest going. P3E will be going up shortly. I have an almost daily QSO on A07, yes a QSO, with a friend Terry G1WPR - sometimes 10 minutes or more. And there are others. The world is much larger than the A051 footprint. It will also give you an opportunity to improve your receiving, which will be needed when P3E goes up.

No, I don't like waiting for the next HEO to go up as my time is probably shorter than yours, but I progressed. If it weren't for AMSAT we wouldn't have the satellites available to us. And what about Martha in the office, what a gal! Be an AMSAT member and not a freeloader. Maybe we should have a contest for AMSAT numbers only - just kidding. That's my take.

Now before you rip me apart and put your flamethrower on, which seems to be the norm on the bb, I can take the heat. Before my retirement I worked in

management with a large heavy equipment hauling firm, in fact we transported the Hubble Telescope and a 33 foot diameter mirror for an observatory, as some items as heavy as 300,000 pounds plus some very secret stuff.

Topic: 808 Message: 808

Hi,

AO-7 was lonely tonight on pass over central Europe (orbit #49958 according to NOVA) !
Very unusual for evening pass. I began my CQ CQ CW when it was over central Africa,
I finished over N.Scandinavia, nobody answered.

Too bad, it was BOOMING... I lost my signal when the footprint was highlighting on
NE coast of Canada! Excellent listening even if I have mountains to this direction and
usually my signal is lost at this point.

73, Mak SV1BSX

Strickly speaking.. you are incorrect....QSL does not mean, what you said
in the above comment....
QSL does not mean 'I acknowledge..... send me a qsl card'....
QSL means that 'I acknowledge what you sent'
If you want a qsl card you have to ask for that separately....
Larry

810. Grammatically speaking ...

Yahoo group: eu-amsat
Date: 2007-08-23 19:34:34 UTC
From: John Hackett
Topic: 802 Message: 810

Larry,
In standard English grammer, three full stops (when used as a punctuation) is used as a seperator in a sentence ... ie, it seperates two *SEPERATE* statements.

It divides the sentence into two parts - "I ACKNOWLEDGE RECEIPT" - and - "NOT !!!, PLEASE SEND ME A CARD. ie ... one being the correct meaning of the QSL designator, the other being the incorrect meaning of the designator.

You have obviously misunderstood the seperator and concluded that the two seperate parts of the sentences were in fact one ... (which they are not).

You've obviously read the sentence as an entirity (which it isn't). There are two seperate statements (on the same line) seperated by the ... (3 x full stop) seperator.

Please try reading the original post again.

Then ... as you will now (hopefully) see, as I previously stated ... that's what I said !!!.

QSL means ... I acknowledge receipt.

The QSL "card" reference was a reference to what it DOES NOT mean ... but what many amateur operators *USE* it for.

Now lets put this one to bed please.

73 John. <la2qaa@...> AO-7 Resource Page Log Admin: EU-Amsat Moderator.

Thomas,
You said ...

>Gentlemen, please look here what QSL means:
>http://en.wikipedia.org/wiki/Q_code

As you may have already seen, the Q-codes were used extensively by the British military and as a British military telegraphy instructor for more than 18 years I believe I've used a fair amount of them in a professional capacity ... Z-codes as well.

Had the gentleman making the comments bothered to check properly, he would have found my original post to be correct.

73 John. <la2qaa@...>

813. For your amusement.

Yahoo group: eu-amsat
Date: 2007-08-24 07:18:33 UTC
From: John Hackett
Topic: 813 Message: 813

For those who may (or may not) have been following the 'QSL' thread.

Here's one for your amusement.

While teaching the budding radio operators 'proceedure' in the British military Signals, it was imperative that they

1) Not have 'mannerisms' as these would immediately be recognised by the enemy and 'logged' ... thereby giving away one's position ... and

2) Faithfully relay a message PRECISELY as it was received.

However ... into that equation often fell 'human error' and after being passed from mouth to mouth several times, what was originally instigated as .... "Send reinforcements, we're going to advance" ...
after several relays in adverse propagation conditions soon became ... "Send three-and-fourpence, we're going to a dance".

A statement giving a COMPLETELY different meaning.

The moral ... What may be perceived as correct, may not always be so ... and if in doubt it is always wise to check with the original instigator of the message before 'transmitting'.

73 John. <la2qaa@...>

814. AO-7 Distance Record.

Yahoo group: eu-amsat
Date: 2007-08-25 17:19:10 UTC
From: John Hackett
Topic: 814 Message: 814
Attachments: 1 described; binary payloads are missing from this source WARC

Hi Mak,
I believe I broke the AO-7 distance record this morning with a
QSO with Patrick K9HF in Madison, Ohio, EM48UN.

EM48UN to Frei Island JP33WB is just over 7800Km according to your DX
calculator.

Unfortunately, the e-mails I tried sending to Patrick at his address on
QSL-COM and Amsat.org have all bounced so unless he reads this and contacts
me with his QSL I cannot confirm the contact.

Just like the one I had on FO-20 with Japan some years ago ... for the
longest distance LEO DX QSO.

However ... I presume you have seen the cards from AL7JK ??.

<http://www.observations.biz/Observations_from_Norway/how_much_power_is_enough_pt2.htm>

I've attached my own card for this mornings QSO with K9HF.

If K9HF ... (or anyone else) ... contacts me with his e-mail address I'll
let you know.

73 John. <la2qaa@...>

Hi John,

congrat's about your QSO, unfortunately I have no time right now to calculate the
distance due to emergency conditions here with fires, I'm busy with emergency
communications.

For calculation I'm using the AZIMUTH programl.
I have this program into "Files" forder of EU-Amsat Group.
When I have free time, I will calculate also the distance.

73, Mak SV1BSX

Gentlemans,
I am really confused!

Thomas I did not know this program, I downloaded just now and it's quite
easy!
Thanks for info!

But, according to this the distance between JP33WB - EM48UN is... 6626 Km !

Not 6598 or 7800 Km as Thomas and John, respectively mentioned !

So, I'm totally confused with your calculations.... and what means that
"to
add 2 ranges"???

73, Mak SV1BSX

PS: BTW the program is OK with other Locators that I have tested, so seems
to be correct.

818. AO-7 Distance record.

Yahoo group: eu-amsat
Date: 2007-08-26 02:27:38 UTC
From: John Hackett
Topic: 818 Message: 818

Hi Thomas, Mak,
Don't worry about it ... (I'm not) ... it doesn't
matter which program one uses to calculate the distance ... Frei Island to
Japan is still the longest LEO contact to the best of my knowledge ...
though that one was on FO-20.

7800 or "merely" 6500Km on AO-7 ... it's still better than a kick up the
arse.

At least I do have the QSL's for the regular contacts from Frei Island to
Eagle River, Alaska.

<http://www.observations.biz/Observations_from_Norway/how_much_power_is_enough_pt2.htm>

However, the distance is not so important but it is interesting to be able
to illustrate what can be done with low power and home brew gear.

NB.

It's refreshing to see more and more American stations rediscovering CW and
SSB on AO-7 but PLEASE !!!! watch the power. The gentleman "crowing" about
your amplifier ... SWITCH IT OFF !!!.

The *ONLY* time you need an amplifier is when you're using a 50 ohm resistor
for an aerial.

(Tongue-in-cheek of course but it is permissible to use common sense). The
newcomer often uses far more power than is necessary ... and I can assure
you, anadequate receiving system *DOES* help.

Remember ... near the horizon AO-7 is 300Km away, at TCA (time of closest
approach) it's only 1000Km above you and you need *A LOT* less power to
communicate.

Please read this ...

<http://www.observations.biz/Observations_from_Norway/howmuchpowerisenough.htm>

That's my calculation:

Home locator:JP33WP
Target Locator:EM48UN
Distance: 6598 km
Azimuth : 295 degrees
Longitude: 90.29166?
Latitude: 38.5625?

Have you an other result ?

> So, I'm totally confused with your calculations.... and what means that
> "to
> add 2 ranges"???
>
We had a discussion about this. My meaning is, you have to add your
range to the satellite and the range from your QSO-partner for a distance
calculation. If you calculate with locators, you get the distance on earth,
not over the satellite.

Hi Gents,
Well, I'm with Thomas HB9SKA on this one.

For a satellite QSO you need to calculate the distance from the transmitter to the receiver ... ie, Station A to the satellite concerned ... and from the satellite to station B ... then add them together to get the true distance the signal travels.

Like Thomas says ... using the locator to locator measurement only gives the "terrestial" distance.

73 John. <la2qaa@...>

Attachments: 1 described; binary payloads are missing from this source WARC

Hi John & Group,

tks but, you can not imagine what happens here ! It's not just a fire on forests, it's a real WAR.
Thousands hectaries are burnt, thousands houses, estates lost. 51 dead peoples till now.

Maybe, a real WAR with guns etc. it's much better compared with this condition.

I don't know what to say... if the "hell" exsist, definitely it's something like that .

Have a look on this satellite image, is taken yesterday... today is much worst. As you can see, the fires are clearly visible (red color) from Satellite !!!!!
The smoke is also visible.....

What can they do peoples, firefighters, airplanes etc against to this fire?
They are now 200 firefaces in South part of Greece, the winds are extremely powerfull, so the fire "eat" forests, mountains, villages in a few hours... just like that.

From: SV1BSX
Topic: 833 Message: 833

Hi all,

well John, if we want to speak precisely, you are correct.

But, in practice this method including several serious problems.

1)very difficult "confirmation" of correct distance. As you can understand, a QSO between "You and Me"
must be calculated if we "freezing" the Sat tracking program, exactly the time where took place
the QSO. Then, we looking for the distance between LA2QAA-AO7 "plus" AO7-SV1BSX.
If that is possible for me and you (hmm, is it ???), definitely is very difficult for any other people in order to be able
to confirm the distance between LA2QAA <===AO-7====> SV1BSX.

2)Under above quota, your "program" and my "program" must be in absolutely equation in time,
Keplerians etc. Otherwise, even between me and you the difference on distance it will NOT 100% equal.
Can you imagine how funny it should be a scenario where you have calculated xxxxx Km,
and me with a difference distance-value for the same, unique QSO via AO-7 ?

3)Can you imagine how many time will must be spent in order to explain the 1st operator to the 2nd operator that,
it is not correct the (for example) 15.678 Km distance but the 16.034 Km, which he has found the 2nd operator and
is not equal with calculation of 1st one !

I can write several similar difficulties with this method, but I will not.

Thus, with the usual method like the direct (terrestrial) ditance between the 2 locators, the measurement is
quite simple and accurate for all. Just put "yours" and "my" locator into a program, like
TinyLoc, and you have the answer. And it's easy for everyone to confirm easily the distance.
Without errors and complicated calculations.
Even if this is not the best measurement, it has a great advantage:

Helps in order to have all a fair, accurate rule for distance's measurement.
That is very important, I think.

73, Mak SV1BSX

Mak,
Under the present circumstances in Greece, AO-7 distance records should be a way down your list of priorities right now.

Be sure !!! that both Thomas and I and the rest of the gang in Amsat-EU are behind you giving you moral support in your emergency communications.

The satellite pictures were really interesting and were undoubtedly a great asset to the authorities.

In the light of future ecological developements we should become more involved regarding amateur satellites and emergency services. The Indians, the Chinese, the Japanese and the Russians are all developing new amateur camera systems ... probably with a view to providing amateur emergency communication assistance. We've all become aware of the flooding and the fires due to the climate changes here in Europe so a few more eyes in the sky would be a boon.

Right now, I'm experimenting with the Russian Molniya satellites on 900Mhz ... (a potential "slot").

My thoughts are with you Mak.

At the time where i was struggling with TVI into my neighbour TV set and stereo system there was period of time where the "unbelievers" accusing me to: interfere, block, disturb their TV pictures even is i was standing in front of them trying to explain the interference on their channel 2 was coming from TV station in Georgia, Carolinas and some as far as Northern Florida.

This period that i called my HF era probably prepare me for my satellite BB flaming era...;)

But it was exciting as i convince my father to install a rotor with a huge multi element TV antenna i remember waiting for our local TV station sign off to be able to get the DX TV stations. My only one reference was a 1974 WRTH issue.

In high solar peak period the summer month was the prime time period and each autumn brings a lot of DX TV activities.

I remember one summer of very high solar episode where our local channel 2 station (Radio-Canada) was completely block by the numerous DX TV signals and this at 50 miles from the transmitter site.

----- Original Message -----

From: "Thailand Amateur Radio Satellites Corporate"
<tamsat_gateway@...>
Sent: Thursday, August 30, 2007 15:21
Subject: Help for Information

Dear all Ham every region,

Thailand at the present, the government sector called ?The National Telecommunications Commission or NTC? has opened the public discussion about the Regulation of The National Telecommunications Commission for Amateur Radio Service Buddhist Year 2550. If this regulation announce, it will be subjected to all ham radio in Thailand whether they are Thai citizen or other nation. For the discussion, they would like to have technical documents with the information that can be referenced to propose to NTC within September 7th, 2007. We, Thailand Amateur Radio Satellite Corporate or TAMSAT Group, have found some problems within this regulation as followed:

Section 3.3.1 says that the station of amateur radio for amateur satellite service is allowed to use transceivers that have maximum output power not more than 10 watts and use the directional antenna only
But in the actual operation, the amateur satellite service can be used with the smalles omni antenna such as rubber dack antenna or mobile antenna to communicate. For the example in URL http://rcfo.batcave.net/fo29movil.html, they use only mobile antenna and omni antenna to communicate via FO-29 satellite.

For section 3.3.2 says that if the use of 145.8000-146.0000 MHz uplink radio frequency causes the satellite to transmit downlink radio frequency 435.0000-438.0000 MHz and it will disturb the use of UHF radio frequency that used in Radiolocation Service or Fixed Service or the satellite transmit downlink radio frequency outside of 435.0000-438.0000 MHz, the Amateur Radio Stations have to stop using 145.8000-146.0000 MHz immediately. But, again, in the actual operation, the signal from satellites in UHF frequency between 435.0000-438.0000 MHz is transmitted downlink radio frequency with very low maximum output power. Even we can receive with the small omni antenna with RF amplifier to amplify the received signal, we can receive in short period of time, let?s say not more than 15 minutes only. (LEO satellites) Therefore, it almost impossible that the signal will disturb the use of UHF radio frequency in other services.

For this reason, TAMSAT Group would like to ask for kindly help from Hams that use amateur satellite service around the world. It would be very appreciated if you could send us the information such as technical

documents, still pictures, or video clips of the station of Ham radio for amateur satellite service and also the information about the RF noise disturbance of using UHF radio frequency between 430.0000-440.0000 MHz in Amateur Radio band in every region. TAMSAT Group will use these information to propose to The National Telecommunications Commission of Thailand afterwards. For technical documents detail please reply to e-mail: tamsat_gateway@... Thank you very much in advance for your all kindly help.

Regards All,

Tanan Rangseeprom, HS1JAN
TAMSAT Group

It looks like the Thai authorities do not want any HAM-signals in
their 70cm-band. Is this band used by police and military ? I think
yes. Can we help ? I think no.

Startm?glichkeit f?r P3E

Unsere Aktivit?ten hinsichtlich einer Startm?glichkeit f?r P3E haben in
den letzten Wochen einige Fortschritte gebracht, nicht zuletzt auch durch
die Reisediplomatie beim Soyuz Customers Seminar in Russland und bei
Arianespace auf der Pariser Air Show in LeBourget. Zwar wird die erste
Soyuz-Rakete nun erst im M?rz 2009 von Kourou aus starten, daf?r bietet
sich f?r uns eine neue M?glichkeit schon vorher auf einer Ariane 5 zu
fliegen. Auch wenn aus Gr?nden der Vertraulichkeit hier keine Angaben
gemacht werden k?nnen, bedeutet dies, dass wir unsere Aktivit?ten weiter
intensivieren und sp?testens im Oktober 2008 flugbereit sein m?ssen. Auch
in Sachen Startfinanzierung m?ssen wir noch einmal alle Hebel in Bewegung
setzen. F?r Sp?teinsteiger gibt es noch die Chance, sich an AMSAT-P3E zu
beteiligen!

Peter G?lzow, DB2OS, 1. Vorsitzender AMSAT-DL

Starting possibility for P3E

Our activities regarding a starting possibility for P3E brought in the
last weeks some progress, not least also by the travel diplomacy with the
Soyuz Customers seminar in Russia and with Arianespace on Paris air show
in LeBourget. The first Soyuz rocket will start now in March 2009 from
Kourou, for it is offered for us on a Ariane 5 to fly already before.
Even if for reasons of the privacy no data can be given here, this means
that we continue to intensify our activities and at the latest in October
2008 be ready for flight must. Also in things starting financing we must
set again all levers in motion. For laterisers there is still the chance
to take part in AMSAT-P3E!

Peter Guelzow, DB2OS, 1. Chairman AMSAT DL

Zur Erinnerung: Pixelaktion geht weiter!

Noch immer hat die Pixelaktion zur finanziellen Unterst?tzung des
P3E-Projekts ihr Ziel nicht erreicht. Wenn sich bei der Spendenbereitschaft
f?r P3E unter den Funkamateuren, die Nutzniesser des neuen Satelliten
sein werden, in den n?chsten Wochen und Monaten nichts zum Positiven tut,
k?nnen Integration und Test des Satelliten ins Stocken geraten. Dabei
k?nnte es sogar passieren, dass m?glicherweise eine g?nstige
Startgelegenheit
verpasst wird, weil P3E nicht rechtzeitig fertig geworden ist.

Wir rechnen mit Ihrer Beteiligung an der Pixelaktion:
http://www.p3e-satellite.org/

To the memory: Pixel action continues!

Still the pixel action did not achieve its goal for the financial support of the P3E-project. If with the donation readiness for P3E among the radio amateurs, who will be beneficiaries of the new satellite, in the next weeks and months nothing does to positives, integration and test of the satellite can coming to a hold turn out. It could even happen that a favorable starting opportunity is possibly missed, because P3E did not become in time finished.

We count on your participation in the pixel action:

From: John Hackett
Topic: 843 Message: 843

Hello Al,
Well I'll be a dog's left bollock.

There I was "messing" with an audio oscillator with the IC-E91 sitting beside me (horzontally) on the sofa ... rubber ducky antenna n' all ...

Suddenly, as clear as a bell ... an English voice ... "you're 59" ... (I jumped out of my skin wondering what the 'L' an Englishman (locally) would be doing saying ... "you're 59".

I looked at the frequency ... no, it couldn't be ... but it was ... 145.920 .... AO-51.

For me to pick it up in a basement flat through my ceiling and my neighbour's roof on a 20cm long rubber duck can only mean that somebody was using *POWER* with a capital *P*.

No WONDER !!! people are complaining about the deterioration in the standard of operating ...
(and we all know who's to blame for that).

(Power to the people? ..... bollox !).

Hello Al,
Obviously, you won't believe this but I can assure you, I'm
NOT lying.

I got hold of an ARROW aerial today and I ain't kidding ... to my surprise
and amazement! they are PRESCISION items. I wasn't expecting this.

I was expecting El: Cheapo alumininium with el cheapo elements like your
average TV aerial. Not so ...
real !!!! 'arras (arrows) ... each one tipped witha rubber end, each one
with an embedded stainless steel bolt that goes through the boom to bolt
into the other half with 'proper' threaded rod.

The workmanship is excellent, the packaging is excellent and the
'instuctions' are excellent. No wonder! they offer a 100% no hassle
guarantee.

Be rather interesting to do some RF testing with it ... (there's a 10w
diplexer in the handle).

Can't wait !!! to try this on AO-7.

It really does break down to a 50 cubits x 9 cubits long package ... (if we
pretend cubits are cm).

Yea, tho' he pointed his aerial to the sky and was sorely amazed ... and he
saw that it was good.

73 John.

From: John Hackett
Topic: 851 Message: 851

Hi All,
I confirm AO-7 was in mode-A on orbit 50087 today, Sunday 02-09-07.

The two stations eagerly waiting in the wings to jump out and say ... 'I told you so' ... relax !, I've got it ... ONE OF LA2QAA's EARLIER ASSUMTIONS WAS WRONG ... an actual human error no less.

Signals this morning were "weak & watery" ... (I heard nobody else in the passband).

It will be interesting to see if the activity is almost zero in mode-A vis-a-vis mode-B as it has been on previous occasions.

After the "referendum" ... (G1WPR and K3SZH and one other station took the trouble to reply) ...
the AO-7 log will remain unchanged. Like the other station said, everybody can see who fills out the log incorrectly.

Mak,
We're on the same page ... those were EXACTLY my thoughts too.

I'm fully expecting "you know who" to jump in later today and say ... I TOLD YOU SO ... but until I posted my mails from Jan King last week, those two individuals didn't have all the facts ... and probably believed the information in the 1974 Amsat newsletter ... (which as we now know, was NOT correct).

Like you say, it will be VERY interesting to see what happens regarding AO-7 modes in the next few days.

I hope you don't mind me posting your comments on the Amsat-bb ... I believe your observation is VERY important in understanding the randomness of the switching circuitry.

GM1SXX and I have another theory but it's a bit too soon to get flamed! for this, we need to wait until after Christmas to make it an even 4 years.

NB.

Both GM1SXX and myself have ALWAYS maintained that there is some !!! battery power ... but not enough to operate the transponders ... we collected VALID data in 2005/6 ... that would explain your observation Mak.

I'll rope Joe in ... (kicking and screaming!) ... so that we have monitors in K3, LA and SV so we can see how things progress.

I checked with QRZ.COM before publishing your e-mail address.

Hi All,
Re: doppler. I've attached K4GMJ's article from the August 1992 issue of Oscar News. It may be of interest to those, like me, who still use old equipment.

In addition to Maury's notes, I can mention, I have used an NE 567 tone decoder IC and a LED as the visual receiver with a simple twin-T audio oscillator for the transmitted signal.
A simple twin-T osc: is better than an NE555 in this application.

I still operate with the Yaesu 290/790 pair + associated homebrew aerials and amps (over 20 years now) and manage quite nicely on VO-52 with InstantTUNE. When set up correctly, the signals track perfectly so even with "old" equipment it's still possible to adhere to THE ONE TRUE RULE regarding doppler.

I don't tune at all for doppler on AO-7.

Occasionally, just for fun, I tune manually ... (transmitter and receiver) .... to keep the frequency constant at the satellite, however ... be aware .... it is *NOT* mandatory to keep the signal fixed at the satellite. Many operators still use the manual convention of tuning the highest frequency .... (because it has the highest doppler rate).

This is perfectly acceptable because not everybody is either 1) affluent enough to be able to afford the latest all singing, all dancing multimode rig ... or 2) not experienced enough to cope with doppler on the uplink and the downlink at the same time.

Hello John and group

I remember me the old and lucky AO-10 and AO-13 days. I had a frequency list of both satellites with corresponding downlink and uplink frequency on one row. If I heard a station on the transponder I know the rough uplink-QRG. For doppler correction I had to send in CW with my Kenwood TS-711E and tune to zero beat. But 1 kHz higher, not on the "QSO QRG" to not disturb the running QSO. Then I had to tune on the "QSO QRG" again and could call the station after he has finished his QSO. This long procedures and nice chats were only possible on a HEO-satellite and not on the LEO's today.

In your article the sentence not to send in CW for zero-beat-tuning is wrong. You can send in CW.

NB: My Kenwood TS-711E and TS-811E are both in operation today. The TS-711E is modified for CAT, 9600 bps Packet and soundcard-CTCSS for SO-50.

Thomas,
A slight correction ... the article re: CW was K4IMJ's not mine.

I've been a "CW man" for 44 years hi.

I still !!!! use corresponding frequency lists ... very useful for "fast"
tuning from one end of the band to the other.

73 John.

856. AO-51 September schedule

Yahoo group: eu-amsat
Date: 2007-09-03 03:07:23 UTC
From: Andrew Glasbrenner
Topic: 856 Message: 856

Hello all,
I posted the new schedule to http://www.amsat.org/amsat-new/echo/CTNews.php Saturday morning. I apologize for it not being uploaded earlier. Thanks to the AO-51 committee for another great balance of modes this schedule.

Now for some notes on the satellite. We are currently running 370 mW on TXA (435.150) and 630 mW on TXB (435.300). Power levels will continue to increase as eclipses get shorter, leading up to 10 weeks of continuous sun early next year. These are going to be interesting times. Keep in mind that anytime we have something other than telemetry running on TXA (i.e. L/U repeater), we may have to interrupt it occasionally for telemetry and satellite maintenance. Our lead command station, Gould WA4SXM, has been doing an outstanding job of squeezing every last drop of power for the downlinks.

Enjoy the satellite, and remember it's never too early to submit your mode requests for October to ao51-modes@... .

73, Drew KO4MA
AMSAT-NA VP Ops

September 2007 AO-51 (AMSAT Echo) Schedule

September 1 until September 30, subject to modification

September 1 - September 10

FM Repeater, V/U
Uplink: 145.920 MHz FM, No PL Tone
Downlink: 435.300 MHz FM

9k6 Digital, V/U, Telemetry Only
Downlink: 435.150 MHz FM, 9k6 Telemetry

September 10 - September 14

FM Repeater, L/S
Uplink: 1268.700 MHz FM, No PL Tone
Downlink: 2401.200 MHz FM

September 14 - September 17

FM Repeater, V/U
Uplink: 145.920 MHz FM, No PL Tone
Downlink: 435.300 MHz FM

9k6 Digital, V/U, Telemetry Only
Downlink: 435.150 MHz FM, 9k6 Telemetry

September 17 - September 21

SSB/FM Repeater, V/U
Uplink: 145.880 MHz USB
Downlink: 435.300 MHz FM

9k6 Digital, V/U, Telemetry Only
Downlink: 435.150 MHz FM, 9k6 Telemetry

September 21 - October 1

FM Repeater, V/U
Uplink: 145.920 MHz FM, No PL Tone
Downlink: 435.300 MHz FM

FM Repeater, L/U (subject to interuption for satellite maintenance)
Uplink: 1268.700 MHz FM, No PL Tone
Downlink: 435.150 MHz FM

Hello Drew,

Thanks for the schedule. Now I have questions about AO-51. Your team
has to look always for power budget and output power. If you look
at the early description of Echo,
http://www.amsat.org/amsat-new/articles/echo_ops/pages/echo2.php,
AO-51 would be a "muscle-satellite" with a programmable torquer for
sunlight and 7 watt output power. I have never heard something about
the torquer after the launch. Is it running or not ? Can you explain
us, why AO-51 is not a "muscle-satellite" ?

Mit freundlichen Gr?ssen, Best Regards, 73

Hi All,

Snipped from Dave's WB6LLO post re: power-mongers on AO-7.

>BUT.....some dork running tons of power managed to overpower us at every
>attempt...deliberately??? or otherwise...
>First time I've had that happen in over 27 years of satellite
>operation...where do these guys come from??

We really do need to nip these guys in the .... err ... (bud) ... and teach them it's *NOT* like AO-51 where the "mine's bigger than yours" mentality prevails ... (he means FM "capture effect, folks).

There are recommended operating proceedure notes on the AO-7 Resource Page, lets encourage the potential newcomers to linear transponders to *READ* them.

25 watts *EIRP* is more than enough to work AO-7 ... PROVIDED ONE USES AN AERIAL and has a pair of those wierd things attached to the side of your head ... (ears) !!!.

To the "unsure" ... pleeeeeeeeeeeeeeeese read this ...

860. Predicting AO-7's schedule.

Yahoo group: eu-amsat
Date: 2007-09-04 07:43:39 UTC
From: John Hackett
Topic: 860 Message: 860

Hi All,
It is difficult to predict or assertain the current operating
schedule for AO-7.

On orbit 50109 AO-7 changed from mode-B to mode-A as confirmed by K3SZH
working W8IJ ...
(in mode A) ...

One would expect the satellite to stay in one particular mode for 24 hours
.... (like yesterday)... but AJ9K logged mode-B at 02:00, as did RW3XL on
orbit 50110 ... before W7LRD logged the transponderr as OFF on orbit 50111.

Be aware that 'some' stations log the transponder as off either because they
are not too careful with the log entries ... or ... the transponder is in
fact on in mode C but they can't hear it.

Two things are certain ... 1) The transponder is *NOT* behaving as one could
expect.

My observations are also verified by SV1BSX "further down the line" ...
(later in the pass).

2) We need to observe the changes over many days to get some idea of
predictability.

73 John. <la2qaa@...>

861. AO-7 report 4th Sept:

Yahoo group: eu-amsat
Date: 2007-09-04 08:22:02 UTC
From: John Hackett
Topic: 861 Message: 861

Hi All,
At 07:56 on orbit 50112 AO-7 was DEFINATELY in mode-A. The downlink was fluttering but this time it wasn't due to alligators. There was no-one else in the passband for the first 10 minutes of the pass over Europe.

I lost the satellite behind the moutains at 85 degrees Az from QTH ... (this is where SV1BSX usually takes over).

Presumably, the mode change occured sometime between 01:45 and 01:55 like the day before yesterday ... and that both the OFF and the B entry in the log for this morning are incorrect ...
(see my previous mail) ... it is unlikely that the mode changed twice !!! within 1 hour ... though it *is* theoretically possible under certain circumstances.

Again ... we need to monotor over time to get a fairly reasonable idea of current transponder switching.

PLEASE !! do ensure the information you enter in the log is correct ... thank you, it is appreciated.

Hello Massimo,

and welcome to the "Club" !

I'm also like you, for a long-long time fan of HF, but the last few years
fan of Satellites. It's a GREAT part of our hobby, even if this period
is not too much "Power" without a HEO.

Are you looking for commercial gear or homebrew?

73, Mak SV1BSX

To whom it may concern,
Please be aware that the NOVA eclipse
predictions DO NOT always agree with other eclipse prediction software. This
can account for certain discrepancies.

The "trick" is to use 3 different programs and pick the "averages".

866. AO-7/Mode-A

Yahoo group: eu-amsat
Date: 2007-09-04 18:25:48 UTC
From: SV1BSX
Topic: 866 Message: 866

Hello all,

just I wondering why the Europeans are not active in Mode-A.

Mode-A at my opinion is easier than Mode-B, you need just a VHF and
your HF gear. The downlink is also easier as the Doppler-shift is minimal
and the downlink signal stronger enough, even if the fading its a bit harder.

Try the Mode-A, PLEASE. Most times the "Grand Old Lady" is lonely over Europe.

That is no good. So, a "rendezvous" with "Old Lady"/A is waiting !

Always we must be Gentlemans with "Old Ladies" !

Gentlemen,
I see I'm not the only one who noticed ... (well done
SV1BSX) ... AO-7, on the 4th of September ... of the 4 European stations ...
(myself included) ... calling, NOBODY managed to raise anyone, while all 6
American stations ... (and 1 Japanese) ... all managed QSO's in mode-A.

Bone idle? ... too easy? ... forgotten how to switch on an HF receiver? ...

OK, it's not a competition but there must be a reason for the continental
difference ... 'theories' may be written on the back of a $100 ... (or Euro)
.... note and sent to La2qaa.

NB.

I am *NOT* soliciting, the last sentence was 'tongue-in-cheek' ... if you
absolutely must !!! get rid
of some cash ... donate it to Amsat.

73 John. <la2qaa@...>

100What's the explanation?.

869. Ao-7's mood (mode) changes.

Yahoo group: eu-amsat
Date: 2007-09-05 08:40:40 UTC
From: John Hackett
Topic: 869 Message: 869

Aj9K has confirmed that AO-7 was !!! in mode B at 02:00 on the 4th of September on orbit 50109.

This is extreemly interesting since K3SZH worked the satellite just prior to 02:00 on the same orbit (50109) in mode-A while myself and SV1BSX confirm it was in mode-A again on orbit 50111.

The satellite does appear to change mode on or around 02:00 in this particular period but this is the first time ... (to my knowledge and assuming the reports *ARE* correct) ... that it has changed mode twice on the same orbit.

Suffice to say, it *IS* being monitored.

871. AO-7 modes use an INVERTING transponder.

Yahoo group: eu-amsat
Date: 2007-09-05 11:05:39 UTC
From: John Hackett
Topic: 871 Message: 871

While it is not MANDATORY to use LSB on the UPLINK of AO-7 it is a CONVENTION ... (there are two very good reasons for this) ... so the gentleman using USB on the uplink on AO-7's orbit 50126 was making quite a mess of two other QSO's.

Please note that AO-7 has an INVERTING transponder and the convention is LSB UP to give USB down.

Two reasons are ... 1) helping to alleviate the doppler effect by the self cancellation method ... an 2) causing less QRM to terrestial users.

Also ... PLEASE !!!!! QRP.

73 John.

Dear John

Makes this noise about QRP around AO-7 any sense ? Fact is, AO-7
listens on the wrong frequency at 432 MHz. Are the Gentlemen who
sends in USB really satellite-OPs ? Or are there 70cm-DXer ?

Please do not understand me wrong, I'm also a satellite user,
but I look over the whole situation.

Mit freundlichen Gr?ssen, Best Regards, 73

Hello Thomas,
I'm well aware of the Terrestial 70cm DX'ers but I have *NEVER* yet heard one call CQ AO-7 ... on the wrong sideband.

The QRM this morning was quite deliberate, I know precisely who this station is and this is EXACTLY what he wants ... attention from other people.

The only reason I mentioned it was for the sake of the newcomer to satellite operations, the station who who has just joined us this refelector.

The gentleman doing the deliberate QRM'ing is best ignored completely.

I mentioned the power because the transponder was FM'ing badly this morning ... this is almost always !! due to excessive power and most people are *NOT* in the habit of decreasing power as the satellite approches TCA.

Well Mak,
The "challenge" is the incentive.

When I worked Joe I had to use knife-edge propagation to creep round the edge of a mountain.

It's fairly common to use a ridge and go over the top but to creep round the side is a bit unusual. You have to use all the tricks available and the propagation has to be just right.

Remember, even though it's *VERY* rare, under the right propagation conditions satellites *HAVE* been heard from the antipodes (exact opposite side of the earth to your QTH).

Aldert PH7PCF and I often used to QSO on AO-7 with me firing at the mountains ... 90 degrees to the satellite ... so never say never.

Could be the power vs battery problem is no battery?
The next step is to put the satellite in a sun synchronous orbit!!!

Its so simple i don't know why nobody ever try it?

It's probably too KISS for the engineers who prefer to work on edge science
project detrimental to the users...

EPS (Electrical Power Subsystem)
The Electrical Power Subsystem (EPS) has to be able to provide sufficient power
to the subsystems under all possible satellite attitudes. The satellite will
not carry any batterry or power buffering. So the satellite will not receive
any power during solar eclipse. The satellite will commence a new boot every
time it receives enough power from the solar cells.

So much for the (convenient) 24 hours timer theory proffered in response to my previous mails regarding the timing of AO-7.

This is the 3rd consequtive day the 24 hour timer is *NOT* playing ball.

05/06 Septembert 2007.

TIME. ORBIT. MODE.

23:46 50133 B
23:51 50133 A
01:35 50135 A
01:36 50134 B
01:44 40135 A

I have received confirmation mails from AJ9K and K3SZH that
their log entries *ARE* correct.

As you Gentlemen on that side of the pond are wont to say ...
"go figure!".

Incidentally, the mode changes spell "baa ba" ... it couldn't be that AO-t thinks we're a veritable bunch (flock) of sheep?.

Just a thought.

An idea?.

After a trip to the new electrical appliance mall in Kristiansund, that, according to their blurb ... "If it runs on electricity, we sell it" ... on asking for a Palm Pilot PDA, I was met with a blank stare and an interogatory ... "a what?".

I was of course looking for something small and convenient to predict satellite passes.

Of course, I have the choice of either lugging around my laptop and using the myriad of tracking software available, also online predictions or carry around sheaves of paper printouts with the pertinent information. I could also plot the passes at home and send myself an e-mail.

Then I thought ... everybody and his dog! has a mobile phone and there are a *LOT* of them that use Symbian software.

How convenient if someone could write a simple satellite tracking application that would run on the Symbian OS mobile phones.

I did suggest this to N1DID (ex: W0EEC) a couple of years ago but Emily has been busy with her Second Life.

I'm just nearing the end of my first (real) one and wonder if this is a good idea or nay ??.

Hey, I have a job, and have worked 26 hours in the last 2 days. Here's the short answer. The torquer is not for solar management, all it does is flip the spacecraft around the Z axis to favor the southern hemisphere with the UHF downlink array. It has never been tested. We could run 7 watts over the US, but thought it'd be nice to share with everyone else. Patience would have brought you a more detailed answer.

73, Drew KO4MA

I got also no answer about AO-51's torquer if it is running or not
and if it is the reason of low TX level (not the 7 watts as propagated
before launch of Echo).

From: John Hackett
Topic: 881 Message: 885

While the following mail was not directed at me personally, it was in part instigated by a mail I originally wrote.

On behalf of Eu-amsat, I would like to apologise to KO4MA Andrew Glasbrenner for the impatence he refers to in his mail.

It is easy to forget that some people have jobs that sometimes involve more than the usual 9 to 5 routine.

Andrew, please accept our apology.

(This mail was *NOT* meant to be 'tongue-in-cheek').

Dear Andrew

Please accept also my apology, it was a "hipshot". Thanks for your answer.
I'm wondering about the low power levels if I see the following site:

Hello Mak

I will try Mode-A during the weekend. My 10m-rig is a Ranger RCI-2950DX
and a L1/2-dipole mounted as inverted-V.

If Mode-A is active, is also the beacon active on 29.502 MHz ? I would
then call in SSB on about 29.450 MHz. I'm not a CW-man.

Now I have to work again, I've also a job ;-)

Jan,
That's precisely the conclusion I came to ... though I'm being e-mailed some wierd and wonderful 'theories' ... everything from the amount of illumination to the colour of my underpants on the days in question.

One of the problems is of course finding precise eclipse software (that is agreement with other softeware). The "trick" is to use three different ones and bat for an average.

(very! scientific ... he he he).

I've made an application for the documentation you mentioned but whether I'll manage to get my grubby little hands on it is another matter. I'll keep you posted.

In the words of the Wallies, Good on yer' mate, no worries!.

John,

Are you sure it’s not because there
is now some eclipse time that is taking the bird down? It only takes a few seconds without a
battery and the timer will be reset or come up random (I think it resets, as I
recall). The way the orbit of the
Earth around the sun works, the minimum eclipse duration for sun sync orbits
should be on about February 10 and the maximum eclipse should be on about June
1. The orbit has drifted so far in
the sunward direction (toward a 6 AM – 6 PM ascending node) that there
may be no eclipse at all now (which is good) but, you would expect to have this
problem you are describing more like in June than in September if it is due to
eclipse. Curious! I suppose the timer could have failed
but, it’s funny to think that it would fail after 31 years and other
stuff would not have. There is
nothing special about those two CMOS gates that would make that circuit any
more prone to failure than any other that is still working. I’d rather suspect something with
the power system driven by orbit changes.
One power glitch would reset the timer.

Subject: Baa ba little lamb.

So much for the (convenient) 24
hours timer theory proffered in response to my previous mails regarding the
timing of AO-7.

This is the 3rd consequtive day the 24 hour timer is *NOT* playing ball.

05/06 Septembert 2007.

TIME. ORBIT. MODE.

23:46 50133 B

23:51 50133 A

01:35 50135 A

01:36 50134 B

01:44 40135 A

I have received confirmation mails from AJ9K and K3SZH that

their log entries *ARE* correct.

As you Gentlemen on that side of the pond are wont to say ...

"go figure!".

Incidentally, the mode changes spell "baa ba" ... it couldn't be that
AO-t thinks we're a veritable bunch (flock) of sheep?.

Just a thought.

Hi Terry, Thomas & Group,

=> OK Terry,
I am surprised why you can not hear the "Old girl". Yesterday I had a malfunction
on my TS-850 and I tryed my old receiver, FRG-7000 by Yaesu.
With my FD3 (Half-Windom) and a homebrew pre-amp, I had easily receiving.
No deflection on S-meter
(this receiver is a little-bit "deaf", indeed !), but it was possible to listen my signal on Downlink, without
problem.
BTW my coaxial cable between Antenna & Shack is about.... 100 ft RG58, 20 years old !!!!

So, check your HF system again Terry. Have you there worst cable than me ? Impossible !

I wish you a good time on holidays.

==========

=>Thomas,

I would be glad if I hear you on AO-7/A. Probably the Saturday it will be active again on Mode-A.
Yes, right, the Beacon is on 29502 but, usually is NO active.

So, try to listen your self by transmitting at 145.900 and looking for your return signal around 29450 (+- a few KHz for Doppler).
For example, I'm starting on +-145.897 @ AOS, increasing my TX frequency to +-145.900 @ TCA,
upto +- 145.903 @ AOS. Thus my signal is stable enough against to Doppler around 29450 on Downlink.
Keep also in mind that, Mode-A is NON-reverse Mode! USB Uplink, USB Downlink !

Good luck on AO-7/A

893. RE: AO-07 orbit 50159

Yahoo group: eu-amsat
Date: 2007-09-08 17:56:27 UTC
From: John Hackett
Topic: 893 Message: 893

Allen,
A pleasure to 'meet' you and have the opportunity to thank you for confirming mode-B for AO-7's orbit 50159.

Very much appreciated Allen.

I'm currently discussing the relays used 31 years ago, with the chief design engineer, J King ... (which are 'latching' and which are not) ... since, as I'm sure you're aware, this, together with the illumination could also play a part in the mode on/off/on/off sequence.

Last year, when I first 'tagged' the 24 hour timer the satellite was in constant illumination ... this time, it's a little more 'debatable' ... (different software packages) ... hence this year's musings re: the mode and when it changes.

Last year I established it to be it on or around 08:30 drifting to 09:00. At present, it appears to be 01:45 to 02:00 ... which in itself is rather interesting.

I hope you don't mind me CC'ing this mail to Joe K3SZH, Mak SV1BSX and a few other interested parties.

I'll do my best to keep the log up to date Allen.

Thank you again for your response.

894. Secret satellite

Yahoo group: eu-amsat
Date: 2007-09-09 14:17:15 UTC
From: Luc Leblanc
Topic: 894 Message: 894

From Hearsat mailing list

An interesting story from Space.com, June 8, 2007,
http://www.space.com/news/060707_graves_web.html

"Secret Satellites

A French space surveillance radar has detected 20 to 30 satellites in low Earth orbit that do NOT figure in the U.S. Defence Department's catalogue.

After 16 months operation of its Graves radar system, which can locate satellites in orbits up to
1,000 kilometres in altitude, the French Defence Ministry says it has gathered just about enough information to pressure U.S. authorities to stop publishing the whereabouts of French reconnaissance and military communications satellites.

The U.S. Defense Department's Space Surveillance Network is the world's gold standard for cataloguing satellites and debris in both low Earth orbit and the higher geostationary orbit at 36,000 kilometres in altitude, where telecommunications satellites operate.

Data from the U.S. network of ground-based sensors are regularly published and used worldwide by those tracking satellite and space debris trajectories. The published information excludes sensitive U.S. defence satellites, but regularly includes data on the orbits of other nations' military hardware.

The Graves radar, and a complementary system operated by the German government, together are enough to pinpoint the location, size, orbit and transmission frequency of satellites - data which the U.S. would prefer not to be broadcast worldwide, French officials said.

'We have discussed the Graves results with our American colleagues and highlighted the discrepancies between what we have found and what is published by the US Space Surveillance Network,' said one French defence official. 'They told us, "If we have not published it in our catalogue, then it does not exist." So I guess we have been tracking objects that do not exist. I can tell you that some of these non-existent objects have solar arrays.'"

QSP from ARRL

ZCZC AG19
QST de W1AW
ARRL Bulletin 19 ARLB019
From ARRL Headquarters
Newington CT August 31, 2007
To all radio amateurs

SB QST ARL ARLB019
ARLB019 ARRL Continues Efforts On Interference To PAVE PAWS Radar Sites

On August 13, the ARRL began sending ''specific mitigation reduction numbers'' to 122 repeater owners, recommending that they reduce their signal anywhere from 7 dB to 56 dB, according to ARRL Regulatory Information Branch Manager Dan Henderson, N1ND. These reductions, requested by the US Air Force and the Department of Defense, only concern those repeaters identified by the DoD as affecting the PAVE PAWS radar system.

''Some reductions are going to be attainable,'' Henderson said. ''You can do 7 dB, but 56?'' He said such a reduction would ''not be realistic to achieve. While many of the affected repeater owners may not be able to achieve the required reductions, but that doesn't mean they shouldn't try to meet the goal. Everyone involved needs to continue trying to meet the DoD's requirements. This gives us the best chance to keep as many of these machines as possible on the air.''

Henderson stressed that any order to shut down a repeater will come from the Federal Communications Commission, at the request of the DoD. ''This situation only affects those repeaters on the DoD's list in Massachusetts and California. It does not affect the everyday, casual user of 70 cm. This is not a wide-spread threat to the 70 cm band.''

Citing an increasing number of interference complaints, the US Air Force has asked the FCC to order dozens of repeater systems to either mitigate interference to the PAVE PAWS radars or shut down. The ARRL has been working with the DoD to develop a plan to mitigate alleged interference from 70 cm ham radio repeaters to this military radar system on both coasts. According to the DoD, the in-band interference from Amateur Radio fixed FM voice repeaters has increased to an unacceptable level. PAVE PAWS radars are used for national security functions, including early detection of water-launched missiles. They are critical to our national defense

and are in use 24 hours per day, seven days per week.

The Amateur Radio Service is a secondary user in the 420-450 MHz (70 cm) band, both by the Table of Frequency Allocations and the FCC Part 97 regulations. As such, Amateur Radio licensees, jointly and individually, bear the responsibility of mitigating or eliminating any harmful interference to the primary user, which in this case is the Government Radiolocation Service that includes the DoD PAVE PAWS systems.

Subject: [amsat-bb] GB5OSO will be active for the 50th Anniversary ofSputnik one launch

Hi All
John ,G7HIA, and myself will be using the special call sign GB5 OSO starting
on the 4th October for one month to celebrate the 50th Anniversary of the launch of the first earth orbiting satellite SPUTNIK ONE on the 4th October 1957 by the former USSR.It is anticipated that all of the available analogue
satellites will be used as time permits but there will certainly be a flurry
of activity starting on the 4th Oct for the first few days then at other times as and when.A special QSL card will be available after the event, so shake the dust off your satellite gear and join in the fun!

Regards Robert G8ATE

Hello All

At the HAM Radio, Europes greatest HAM fair in Friedrichshafen Germany, was a TV-team from Dr. Dish TV, a German private TV-station, at the booth from AMSAT-DL and makes a movie. If you understand German, watch it at http://www.youtube.com/watch?v=e7aYXXghQPU . Of course you can watch it also if you don't understand German :-) Have fun.

The resulting predication is, we need much more money to start Phase-3E.

The video was mentioned in Tuesday's edition of the Daily Amateur Radio RSS news
http://www.southgatearc.org/news/september2007/amsat_dl_video_news.htm

I presume Dr Dish TV is a satellite TV company ?

It was good to see AMSAT-DL got a mention of the fund raising site at
http://www.p3e-satellite.org/index.pl

Hello Al,
Well they chucked me out of the hospital when I started slinging me' gob at the doctors on their morning 'rounds'.

The clowns had refused to allow me to set up the satellite gear in the 4 man ward ... (I had an Arrow antenna and the IC-E91E + laptop with me) ... so I didn't manage to make the planned LA2QAA/H ... (hospital) ... satellite QSO and had to make do with a measly Molde repeater (from the toilet) QSO.

Operations (Medical).

Apparently, from what I can gather, they found an old chunk of plastic tubing in the cellar so they stuck that in my main artery. The legs now appear to work as per the 'instructions ... (one before the other, reoccuring) ... so the medical operation was a success even if the stroke/H radio operation wasn't ... mind you, there's talk of doing the other leg so I still might manage that satellite QSO before the towel gets chucked in.

File the attached JPG of the thigh keyer, used with an FM dual band handheld to send MCW up ... (receiving on AM down).

I'm doing an article for 'Observations' for those ... 'I can't use a linear transponders because I only have an FM rig' ....
people.

Mak was asking about me so I've batted this mail to a few of the other reprobates that frequent AO-7.

The real reason of course is my bone-idle nature ... I'm just too lazy to type several mails.

We used to use thigh keyers in the Signals when on tactical ops. You can see the size of it by the micro-switches I used for the actual iambic keyer. Works perfectly! on AO-7.

73 John.

Hi Agn,

So what did they do to you in hospital and how long were you in for?
Stent? Arterial graft? What?

One of our guys here at work got bitten by on the toe by an insect while changing into his work boots and ended up seriously ill in hospital for a week. They didn't find what bit him

so they tried all manner of IV fed antibiotics and eventually found one that worked. His foot and leg got seriously infected from the bite.

Projects here... almost nil. I do plan a tuneable wire loop for the lower bands and a new mag-loop for 20M and above. The HF vertical will be axed. I'm also planning some new beacon software using a FLASH PIC. I hope to be able to just send a message to it and have the PIC send it in CW and possibly also in FSK ASCII at high speed.
At the moment, changing the message contents is a bit laborious.

Hi Thomas & group,

well, they are also several operators on SSB (ie G0VHS, DO9OAM, IW4DVZ,
OT6T,
DH5MK, HB9OAB, OH2LHE, DM9LSB, IK0DPX ... & more).

I think the main problem for this low activity it's the difficult & weak
reception
of AO-7's downlink (@ 29450). Some operators just... they can not hear the
Satellite
and some others they hear it but, very weak.

For this reason, CW likes to the majority of operators because is
much-much easier
Mode for Satellite reception under limited conditions.

And finally, the matter is that for... non-explainable reasons the
Europeans are... last on Mode-A,
far away behind of US's & Jap's Sat-Operators.

Bad European-HFs? Bad European-antennas for 10m Band? Strange magnetic
fields over
Europe? UFOs ? supernatural effects? ..... he he

Hmm, ... it's a great mystery why the Europe in Mode-B is *champion* and
in Mode-A.... bottom ! .... nobody knows !!!

Have a nice Sunday

73, Mak SV1BSX

Hello Folks,
I concur with Mak,
That is PRECISELY why the European operators favour CW in mode-A on AO-7 ... the difficulty of receiving an edequate downlink. Most operators not already having a good 10m aerial view it as being not worth the effort to erect an 'effective' mode-A aerial for AO-7.

Like Mak correctly states, there are many!! SSB operators ... but for the above reasons ... they operate mode-B.

Most people *ARE* aware of the power problems on AO-7 but unfortunately, we still see the occasional station knocking the transponder silly with amounts of power that would be embarrassing on EME.

Please do try regulating your power as the satellite approaches you (TCA) ... you'll find that when it's above about 25 degrees you can communicate with *HALF* the power you use when the satellite is near the horizon.

Likewise, those using beams ... try using the half power beamwidth to your advantage ... ie ... line your aerial up so that the zenith is on the satellite at the horizon and the -3dB point falls at TCA ... you might be surprised.

NB.

These *amplifiers* are FREE !!!.

.... Thomas,

at my opinion PSK31 is not recommended Mode for AO-7.

As you know, the "Old girl" working with Solar panel's power and it's very usual the "chirp-chirp" effect
and sometimes the heavy distorted Downlink signal (plus FM-ing).

So, it should be a great problem for PSK31's downlink-tone, as it's very difficult to remain stable

enough, clear and without distortion for an accurate decoding.

Another problem for AO-7, due to limitated Power budget, is that the PSK31 "pushing"

the SSB transmitter to (almost) full power output, with 100 % duty sycle.

That is not recommended working condition for AO-7, we have to care about this bird

by using as low as possible Uplink power.

Of course, Ham-radio is experimentation. So if someone has a fully controlled transmitter about EIRP output,
for example between 5 - 50 Watts and thus always looking for the best, clear and non distorted downlink signal by keeping the output Low enough,
and (if) he is very careful man and knowledgeable operator, yes, he could be tried, why not.
Especially when the AO-7 is lonely, without any other user.

Thomas,
Since PSK31 was specifically designed for low power operation (with narrow bandwidth) it ought to be a suitable candidate for operation n the mode-A transponder.

For those wishing to try PSK31 via satellite.

Points to remember ...

Do *NOT* increase the transmitted power to compensate for a less than optimum receive signal.

Peter Martinez (the founder of PSK31) was unsuccessful with this mode via satellite ... as was PH7PCF and LA2QAA.

Remember, the bandwidth is *EXTREEMLY* narrow but it might work on mode-A at 29.5Mhz. Aldert and I tried it in mode-B where it *DOESN'T* work ... due to the doppler.

In all cases, a *GOOD* receive aerial will be necessary.

The obligatory rusty 6 inch nail just isn't good enough.

One again, I agree with Mak ... just use common sense.

A sked when the bird is not overloaded just might produce a result in mode-A.

I can assure you, mode-B has been tried extensively and PSK31 *DOESN'T* work in this mode.

914. AO-51 mode requests for October

Yahoo group: eu-amsat
Date: 2007-09-24 18:42:48 UTC
From: Andrew Glasbrenner
Topic: 914 Message: 914

It's that time again! If you have any requests for the month of October, please submit them to ao51-modes@... as soon as possible. We already have several requests for the month, but will try to accommodate every one, as always.

73, Drew KO4MA

915. Mode request

Yahoo group: eu-amsat
Date: 2007-09-24 19:23:59 UTC
From: Thomas Frey
Topic: 915 Message: 915

Please Mode L/U without Mode V/U, if possible during the whole October.
With mode V/U you have a "zoo" in your loudspeaker or headphone.
Thank you very much.

Mit freundlichen Gr?ssen, Regards, 73

Has AO-51 enough power for the S-downlink ? I hear allways nothing
on S with my 1.2 m dish. Indeed I have the dish under and not on
the roof. The feeders are LHCP-helices for 23cm and 13cm. On 23cm I can
chat with 15 W PEP with my Icom IC-1271E. With a 13cm signal generator
I have a big signal, but not from a satellite. The last satellite
I could hear on 13cm was UO-11.

Thomas, AO-51's S band downlink is huge. I routinely work it with a dipole and corner reflector. See http://www.pbase.com/tomcat/image/43947505 and the next few pictures for how simple the equipment can be.

Mak, I'm afraid we cannot run U/S. If the satellite was to have a software fault or watchdog trip (low battery, etc) the 435.150 transmitter powers back up by design and could blow the front end of the SQRX receiver.

Ah, "excluding V/U" - I'm not alone :-). I explained Drew our European situation in a direct mail. The only solution would be to switch CTCSS on again and that we are users and no detectives, who investigate jammers. In future we can use (I will) this group to report the passes of AO-51.

Off topic: About [SPAM] in the mail header: my address is disregarded by real spammers and a few american ISP's puttet it on a black list. I have a 2nd address and would change to it in the near future.

Topic: 915 Message: 921

Hi all,

dr Thomas, definitely we are not just YOU & ME "negative" about AO-51's V/U-Mode over Europe, I have heard dozens operators with the same opinion.

You pointed-out the use of CTCSS again. As I remember (Am I wrong?), it was not better with use of subtone. In contrast, I remember that during V/S Mode the jamming was ZERO (... & without CTCSS).

So, here we have a "strange" question:

why if used a different Downlink-Band than UHF the jamming is minimized even if the Uplink remains on VHF ??

Well, at my opinion, the jamming happens on V/U Mode just because the majority of "future" Satellite operators have easily access on these Bands, because of nowadays VHF-UHF Bands are available into any cheap Dual-band FM-transceiver .

And there are not just the future operators which they trying the AO-51 by pushing the PTT.... there are also
several "rookies" which they trying also to access the Satellite - even if they can't hear their own signal on Downlink.
They are confused because some signal is always audible on Downlink, always a carrier is "ON". They are without experience and just wait to hear their own voice on Downlink. Always by pushing again & again the PTT.
Unfortunately, FM is very common Mode today, so it's very easy for anyone to buy a cheap FM-transceiver for VHF-UHF Bands, including illegal operators, in order to generate jumming.

But, when the Downlink changes to L-Band (or S-band), the situation is completely different.
Here just a limited number of Radio Amateur operators they have L-Band transceivers and good enough antennas for Satellite access (and the necessary knowledge about SHF).
And the difficulties are bigger, the equipment is much more difficult on S-band, where only the old-users of (deadly now) AO-40 they have S-band capabilities .

So, it's obvious for me why the jamming is eliminated when the AO-51 changes Downlink-band on L or S-Band -even if the Uplink remains to VHF-band without CTCSS.
All these peoples, "rookies", "deaf peoples" about Downlink etc, THEY CAN NOT hear the Satellite on L or S-Band and for this reason they don't push their own PTT.

Of course, in your favorite Mode (L/U) the Downlink is audible from all these peoples on UHF-band, but in this case they haven't L-band TX to ...push PTT ! Fortunately for us !

Conclusion: the jamming on AO-51 over Europe can be prevented if used the VHF-band as Uplink or Downlink, but NEVER together with UHF Band.

Prefered Modes are V/L, V/S. Also L/U has not problem, as above mentioned (I think S/U & S/V are not possible, and definitely U/S as Drew, KO4MA pointed-out before).

Just my "2 cents worth".

Mak,

I agree with much of your last email as to the sources of problems. However, it would be extremely elitist and selfish to discontinue V/U just so the relatively fewer L and S band ops can play at their leisure, with less competition for the uplink. Those members and supporters deserve to have a satellite they can use with their equipment as much as anyone else, don't they? AO-51 was promoted as a "easysat" meaning simple V/U FM equipment, and it has fulfilled that role. The other capabilities are more or less a bonus. I have done my best to include them as much as practical, but they will not become the primary modes. It simply would not be right.

By the way, L band cannot be used as a amateur satellite downlink. AO-51 can run V/U, L/U, V/S, and L/S and nothing more.

73, Drew KO4MA

OK, this is an argument. But fact is also, since the CTCSS (subtone) is
switched off, we have addionally russian phone-nets with bla-bla on the
downlink. And the QRM increases steadily without CTCSS. On the other hand
I heard also new OM's from Russia. But this is only a drop of water on a
hot stone (German adage).

>
> So, here we have a "strange" question:

On V/S we have another uplink channel, this could help.

We have only uplink on L-Band. A further solution would be to experiment and
change the uplink-frequency.

See my explanations above.

>

No, the jammers jams simplex on 2m. The OM's without ears and a big mouth
or yap are crocodiles, like in the old AO-10/13 days.

>
> Conclusion: the jamming on AO-51 over Europe can be prevented if used
> the VHF-band as Uplink or Downlink, but NEVER together with UHF Band.
No sorry, this is a wrong conclusion. If the jammer jams on the uplink
which corresponds to L- or S-downlink, then you have the QRN there.

Another interesting mode is also 29 MHz (10m) up and 70cm down in
PSK31 or CW for the CWist. I would prefer PSK31. There are so many
possibilities to experiment with AO-51. Why only V/U repeating ?

Drew, why not a week with mode X, mode Y, mode Z and so on ? At
weekends the controlstations has allways time to switch. My 2 Cents.

If you are not ready for a compromise, I am, then AMSAT-NA has to
declare AO-51 as investigative satellite for no room for European

amateurs. This has also nothing to do with ham spirit.

PS: this mail goes also CCed to EU-AMSAT.

That is a ridiculous statement. I've explained the reasoning behind the decision, as has OZ1MY, who is the European representative to the AO51 committee. We do not run the satellite based on the demands of one operator in one region, and we will not exclude hundreds of users worldwide because you don't want to hear any QRM or competition on the satellite. We have to make these decisions based on what's best for the most users worldwide, and obviously we cannot please everyone at once.

Unless there is some new "evidence" or thinking presented, I've spent enough time on this particular subject.

926. AO-51 modes.

Yahoo group: eu-amsat
Date: 2007-09-25 21:24:13 UTC
From: John Hackett
Topic: 926 Message: 926

Hi Mak & Thomas,
As much as I 'personally' disagree with FM satellites ... due to the single user phenomonen (capture effect)
... I do agree with the points Drew made in his mail.

There are a *LOT* of operators with simple gear and little experience out there and it 'would' be elitist and selfish if the more experienced among us demanded that AO-51 be switched to modes favouring the 'experienced' operator only.

As for the poor standard of operating ... (this is why I loathe FM saterllites) ... It's up to the experienced operators to teach the newcomers by examples of good operating proceedure.

Drill in the main points over and over again ... like 'NEVER' more uplink than the beacon (where available) and *DO NOT* transmit until you can't receive adequately.

There are several well written operating proceedure notes and articles for operating FM satellites like AO-51. A pity that some people just ignore them ... but that is a fact of life. We can only teach by example and hope that the situation improves ... try to bring the 'pride' back into satellite operating ... with the *gentleman's' aproach.

Remember !!! ... IGNORE the poor operators and they will get tired and move on. It's only when they get 'attention' that they persist in their games.

The 'genuine' newcomer will soon learn if he's encouraged ...
the LIDS will never learn ... just ignore them.

Gentlemen

Our problem is NOT the poor operation ! We have a problem of jammers
like russian telephone-nets, taxis and other stuff on 2m ! Tell me
the solution please, that we can have our QSO's again. Now it is
nearly impossible to talk via AO-51 in V/U. Thank you.

Gentlemen

Our problem is NOT the poor operation ! We have a problem of jammers

like russian telephone-nets, taxis and other stuff on 2m ! Tell me

the solution please, that we can have our QSO's again. Now it is

nearly impossible to talk via AO-51 in V/U. Thank you.

Mit freundlichen Grüssen, Regards, 73

From: SV1BSX
Topic: 926 Message: 929

Gentlemen,

I read all these about "Elit, Elitist" etc. from your side, and I am a little-bit surprised.

Sorry but, I have a different point of view.

* "Elitist" for me is anyone which uses 1-2 KW ERP in order to work this bird on V/U FM-mode by "beating, erasing & killing" all weak stations, rookies, simple gear and little experience operators. That is for me the real ELIT... and unfortunately exactly that happens several times over Europe on AO-51 (aka "EASYSAT" !!!... How ironic, indeed).

* "Elitist" is If you have a "monster-type" antenna system and high enough power, in order to access the Satellite any time, over any other weaker station.

If you have not the above mentioned, just forget it... no lucky for rookies. Or, you have to wait for the pass... in the middle of the night, when the "Goliath" is going for sleep... and thus, the "bantam David" is looking for a better luck with his tiny "Arrow" and handheld's 5 Watts !

* But it is not "Elitist" for me to switch-on the Satellite on a higher Band than V & U.

* It is not "Elitist" the encouragement of Satellite operators -especially the rookies, to involve with new things, higher frequencies etc, if that is necessary for better and easier Satellite communication.
If they havn't the L or S-band gear, it's a great opportunity to get into that.
It's a challenge that, nothing to do with ELIT. In order to explore new things, new techniques, antennas and "new worlds" from rookies's side.

Do you remember the AO-40? Had we any experience before AO-40 on S-band many of us?

NOooooo...

but it was a great challenge for all, including rookies (and I was also a "rookie" on AO-40 about 2.4 GHz).
And through AO-40 we explored a new Band, we learned about too many new things, and really we enjoyed it.

That is not "Elitist", it's our hobby.

So, who is talking here about "ELIT" ? ...

73, Mak SV1BSX

PS: BTW Gentlemen, I didn't say "shut-down" the V/U-Mode on AO-51. I said "prefered" Modes for Europe , as my personal opinion-suggestion to "Mode Request" ....with a footnote (if you didn't read that) : "just my 2 cents worth"

So, too much dust on the air.... for nothing, I think. And honestly, I will never involve with that again.

Cheers

930. AO-7/A: for better signals...

Yahoo group: eu-amsat
Date: 2007-09-26 18:46:57 UTC
From: SV1BSX
Topic: 930 Message: 930

Hi all,

this evening I was calling CQ CW on Oscar-7, Mode-A (@ 29450) and also I was looking for any other user, between 29940 - 55 KHz.
My signal on 29450 it was decreasing, almost to Zero, even if the Sat was high enough. It was a very weak pass.
Then I remembered the "noise zone effect" which happens on Mode-B, so I jumped to 29440, where the noise was
much stronger. I retuned my Uplink, I sent again several dashes & dots and ...Voila ! My signal was 559 here !
I jumped again to 29450, I sent dots & dashes... NOTHING here !
Back again to 29440 where the noise was strong, once again my signal on Downlink was 559 !

So, it's obvious that the "noise zone effect" lives also here, in Mode-A. Just keep in mind.
It is smart to try CQ on CW at this frequency (29438 - 29445) and not on the Middle PassBand (29450).

Enjoy Mode-A !

Hello Mak

You made very interesting observations. AO-7 has the only linear-transponder with 2m-uplink. Can you make a "frequency-map" over the whole passband and on different locations of AO-7 ? This would be a very interesting study.

Hi all,

I found (randomly) on YouTube a nice video.
It's a presentation for Amateur Satellites, not new (2004) and mainly for P5-A, but including
also a very interesting part about Phase-3 Sat's. The best I have ever seen.

http://www.youtube.com/watch?v=iIJ548EyUME

73, Mak SV1BSX

PS: of course you need a broandband Internet connection, its about 10 mins.

937. AO-7 mode-A

Yahoo group: eu-amsat
Date: 2007-09-28 06:58:29 UTC
From: John Hackett
Topic: 937 Message: 937

Hello Folks,
Makis does appear to be correct ... (stand up! that man who moaned "again!") ... about mode-A on AO-7.

I have the worst possible QTH ... (mis-placed and ill-designed mountains) ... and a less than optimum 10m aerial ... 14Mhz sloping "v" nailed to the top of the landlord's balcony door (!) ... about 5m above ground ... this will "theoretically" produce a "fat" dohnut radiation pattern with 4 x lobes at 30 and 45 degrees ... (vertical radiation angle) ... and since a transmitting and receiving aerial are reciprocal this "beast" ought to grab the odd electron or three as they whiz past the 'electron-grabber' on 29.450Mhz.

Actually, it does ... I heard my own downlink at S4 for the entire pass ...(transmitting with 7 watts from a 20 year old FT-290RII ... -3dB coax loss ... feeding a Wimo X-quad on 145.900Mhz) ... however, I might as well have emulated Roy Orbison's "Only The Lonely".

I would have thought 'somebody' in Russia might have a 2m transmitter and 10m receiver. 06:30 is 09:30 in Mocba (Moscow).

73 John. <la2qaa@...>

938. Fw: OSCAR-11 Report

Yahoo group: eu-amsat
Date: 2007-09-28 11:02:20 UTC
From: SV1BSX
Topic: 938 Message: 938

OSCAR-11 REPORT

27 September 2007

OSCAR-11 is back! During the period 31 August to 27 September 2007, the satellite's 145.826 MHz. beacon has been heard from 16 to 26 September. The switch-on date was later than expected. The solar eclipses finished on 20 August, and previous observations had suggested that the duration of sunlight after 10 August would be sufficient to support continuous operation. However, at the end of last year's eclipse season, some erratic behaviour was also observed.

Unfortunately I was away on holiday when the satellite first switched ON, and only received the data on last two days of transmission. Signals were weaker than those received earlier in the year, ie. before the eclipse season. This has been confirmed by the many reports I have received.

The on-board clock has continued to be of interest. At the end of this ON period the clock was 69.43451 days slow, showing a loss of about 31 days since the previous ON period. The day of the week counter appears to be consistant with the date on the satellite, but has changed in relation to the actual date. Previously, 0 represented Thursday, now it represents Monday.

If the satellite's watchdog timer continues to operate normally, the beacon should switch ON around 06 October 2007.

I am indebted to Peter ZL3TC, Ken W7KKE, Dave G1OCN, Jef KB2M, Graham G3VZV, Martin M0ADY, Gustavo LW2DTZ, John N7ZL, John N3NKC and Thomas HB9SKA for their reports. They were especially useful while I have been away. Many thanks.

The satellite is now in continuous sunlight and this will continue until around 14 November, when there will be a short eclipse season, lasting until around 07 January. However the maximum duration of the eclipses will only be about seven ninutes. At this level the satelite might just survive.

The current status of the satellite, is that all the analogue telemetry channels, 0 to 59 are zero, ie they have failed. The status channels 60 to 67 are still working. The real time clock is showing a large accumulated error, although over short periods timekeeping is accurate to a few seconds per month. The day of the month has a bit stuck at 'one' so the day of the month may show an error of +40 days for some dates. The time display has switched into 12 hour mode. Unfortunately, there is no AM/PM indicator, since the time display format was designed for 24 hour mode. More data is required to determine exactly when the date changes.

The spacecraft computer and active attitude control system have switched OFF, ie. the satellite' attitude is controlled only by the passive gravity boom gradient, and the satellite is free to spin at any speed. When telemetry was last received it showed that one of the solar arrays had failed, and there was a large unexplained current drain on the main 14 volt bus. After 22 years in orbit the battery has undergone around 100,000 partial charge/discharge cycles, and observations suggest that it cannot power the satellite during eclipses, or sometimes during periods of poor solar attitude.

The watchdog timer now operates on a 20 day cycle. The ON/OFF times have tended to be very consistent. The average of many observations show this to be 20.7 days, ie. 10.3 days ON followed by 10.4 days OFF. However, poor solar attitude may result may result in a low 14 volt line supply, which may cause the beacon to switch OFF prematurely, and reset the watchdog timer cycle. When this occurs, the beacon is OFF for 20.7 days.

The Beacon frequencies are -

VHF 145.826 MHz. AFSK FM ASCII Telemetry

UHF 435.025 MHz. OFF

S-band 2401.5 MHz. OFF

Listeners to OSCAR-11 may be interested in visiting my website. If you need to know what OSCAR-11 should sound like, there is a short audio clip for you to hear. The website contains an archive of news & telemetry data. It also contains details about using a soundcard or hardware demodulators for data capture. There is software for capturing data, and decoding ASCII telemetry. The URL is www.users.zetnet.co.uk/clivew/

If you place this bulletin on a terrestrial packet network, please use the bulletin identifier $BID:U2RPT137.CWV, to prevent duplication.

I forgot this video. It was produced 2004 from DG1OWK for presentations
at fairs and ham fests. You can order a CD for only 5 Euro:
http://www.me-blanz.de/amsat/vertrieb/literat.htm

The CD is in SVCD-format so you can play it on your PC or on a DVD-recorder.
There are an Englisch and German version on the CD. For French you have order
it separatly. If you want only 1 CD, put 5 Euro in a SASE and send it to
Martin Blanz, DL9SAD. Address see QRZ.COM.

940. Balloon launch for Sputnik jubilee

Yahoo group: eu-amsat
Date: 2007-09-29 15:17:40 UTC
From: Thomas Frey
Topic: 940 Message: 940

Hello All

The radio amateurs from the "Sternwarte Bochum" (observatory of Bochum Germany) will launch a weather-balloon with a 2m transmitter. On 145.200 MHz in FM it would transmit the callsign DA0SPUTNIK and the historic signals from Sputnik. The power is 1 Watt in a whip (or similar) antenna.

If the balloon rises to an altitude of 25 km it could be heard in whole Central Europe. The launch is on 4. October at 00.00 MESZ or 3. October 22:00 UTC from Bochum, JO31ok. The duration of the mission would be 3 to 24 hours.

From: John Hackett
Topic: 941 Message: 941

AO-27.

Easysat ? ... right !!!l.

I've been trying (unsuccessfully) to figure out how to tell when the AO-27 transmitter is switched on over my QTH ... (Frei Island JP33WB) ... or not.

Of course, any tracking program tells me *WHEN* the satellite is over my QTH but tracking programs don't tell me whether the transmitter is switched on or not.

The AO-27 scheduler supposedly does this ... the only problem is
... I find it thoroughly confusing.

The passes (according to any tracking program with the latest keps) and the AO-27 scheduler don't seem to agree ... (me'thinks John is doing something wrong !!!) ... or ... from the scheduler I can see if the transmitters are on (or not) when the satellite is well out of my footprint ... but I'd like to know whether it's on when the satellite is workable from my QTH.

Is there anyone out there who can explain in words of one syllable (or less) how one figures this out ... and then explain it to a thick and illiterate old sod like me.

This mail is in NO WAY meant as any form of criticism of the AO-27 scheduler, it is ENTIRELY me being TOTALLY stupid! and not being able to see the wood for the trees ... and asking for HELP.

How about an example that a 5 year old could understand?
(Even I might have a chance then).

73 John. <la2qaa@...>

Topic: 941 Message: 942

It's on during ascending passes in the northern hemisphere, which should be your local afternoon passes. It turns on by timer at roughly 30 degrees latitude (this varies a bit) and is on for 7 minutes. THe link on www.ao27.org that says "24hr listing" will give you the exact repeater=on times. Look for "Analogue Med". I think that being as far North as you are you may only have a few minutes per pass visible for you.

Good Luck

Subject: [SPAM] [eu-amsat] AO-27 scheduler

AO-27.

Easysat ? ... right !!!l.

I've been trying (unsuccessfully) to figure out how to tell when the AO-27 transmitter is switched on over my QTH ... (Frei Island JP33WB) ... or not.

Of course, any tracking program tells me *WHEN* the satellite is over my QTH but tracking programs don't tell me whether the transmitter is switched on or not.

The AO-27 scheduler supposedly does this ... the only problem is
... I find it thoroughly confusing.

The passes (according to any tracking program with the latest keps) and the AO-27 scheduler don't seem to agree ... (me'thinks John is doing something wrong !!!) ... or ... from the scheduler I can see if the transmitters are on (or not) when the satellite is well out of my footprint ... but I'd like to know whether it's on when the satellite is workable from my QTH.

Is there anyone out there who can explain in words of one syllable (or less) how one figures this out ... and then explain it to a thick and illiterate old sod like me.

This mail is in NO WAY meant as any form of criticism of the AO-27 scheduler, it is ENTIRELY me being TOTALLY stupid! and not being able to see the wood for the trees ... and asking for HELP.

How about an example that a 5 year old could understand?
(Even I might have a chance then).

Hello Drew, thanks for the mail.

Yes, I've understood the principles ... it's just that I can't seem to get the math to tally ... I REALISE THE FAULT IS MINE !!!! but I can't see where I'm going wrong.

I see the various modes over other QTH's ... would one have to backtrack a tracking program to "spot" AO-27 at a particular scheduled moment and then work things out "manually" ??.

(I'm confusing myself !!!!).

The reason I was interested is ... I recently purchased an IC-E91 handheld for use on AO-51 portable and noticed that the AO-27 control operators encouraged D-Star.

D-Star repeaters being pretty thin on the ground in Europe (one I believe, in the UK ... paradoxically none !!! in Japan, hi hi) ... I thought AO-27 might be an opportunity to try this mode.

I'd read that not all transmitters/receivers are suitable for D-Star and I've seen no mention about it re: AO-51 ... and not wanting to show my ignorance nor insert a size 10 in my mouth I assumed AO-27 would be my best bet ... however ... it does look like it's a non-starter anyway !!! due to my QTH.

I suppose I'm out of luck with D-Star on AO-51 ???.

The next bit is personal and "off the record".

I've been playing with analogue satellites for a lot of years but am about to relocate to a retirement home where aerials are *NOT* permitted so the IC-E91 and an Arrow aerial are my only options to stay active.

Any other "ideas" for utilising the IC-E91 on AO-51 (D-Stars?) or otherwise, would be greatly appreciated Drew. The local repeater is BORING !!!.

You'll recall I asked you about the possibility of MCW ... whether it would be frowned upon on AO-51 ... now you know why I asked.

Drew,
I just found this through a search ... very
encouraging indeed (re: my last).

73 John. <la2qaa@...>
.....

Gentlemen,

Please do not use FM on any of the transponder satellites, whether D-Star or plain FM. FM of any kind is expressly unwelcome on AO-7 especially.

If you would like to set up a test of D-Star via AO-51, please organize the effort and send a request to schedule it to ao51-modes@... or to myself directly and we will accommodate the test on a FM satellite, where FM belongs. I think it'd be an interesting experiment.

Hello John

If you think, your AO-27 schedulerprogram doesn't work right, do the following: Click "File - Update Data". You must be online. At the moment the schedule times and the onboard clock are matching. But about in the middle of my orbit from JN47ck the transponder switches off. Its possible at your northern QTH, that you can't work AO-27 at all orbits.

To AO-51: This evening at 19:22 and 19:23 I worked OT6Z and LX1BB via mode L/U without any QRM. Neither from russian telephone-nets nor from any radar. AO-51 is truly an easy-sat in mode L/U.

On AO-27 I could also hear telephone-calls :-(

Hi John,

well, as I know you have problems with High mountains to South directions, so I believe it's difficcult for you to access this Satellite. If you havn't "clear horizon" to South (Europe), I can't imagine how is possible to work the AO-27 from your QTH.

In general, AO-27 is very simple. Every afternoon this bird has 2-3 asceding passes over Europe, from South to North.
With simple words, when the Satellite is over Mediterranean-sea is switched-ON for about 6 mins -till North Europe.

These 6 mins are enough to have access on Satellite almost the majority of European countries, but the Satellite comes "OFF" over N. Europe (or about South Scandinavia).

Keep in mind that, during morning (descending) passes over Europe, the Satellite is always OFF. Only during the afternoon
ascending passes is "ON", over Europe.

Another important point in order to recognise when the Satellite is ON (and OFF) is that:

if you are listening on 436.800 and the Satellite is coming from South, just before the "switch-ON" you will
receive (for a few seconds) a Packet-radio signal, 1200 Bps AFSK. If you have involved with Packet radio,
the AO-27 sounds like the well known (old) BBS on VHF!
Just the same happens close to "shut-down" of AO-27 (over N.Europe). If the whole pass is 6 mins you will hear also Packet-radio transmission at 5'30'' -5'45'' and after that, "GAME OVER", the Satellite is "OFF".

Therefore....

I'm not using any other program than NOVA for AO-27. My method is simple:

I'm looking on my PC where is the Satellite. Close to N.Africa - Mediterranean I'm listening to +-436.800, in order to
receive the Packet-bursts for a few seconds. After that I know that the Satellite is ON, so I call CQ.
I'm always watching my PC for the Satellite's orbit. Close to N.Europe I'm very fast with QSOs, as is possible
to hear suddenly the "final" Packet-bursts. Then, the AO-27 is OFF.

That's all.

BTW the AO-27 is a great Satellite, it has very good and sensitive receiver -even if is old enough. It has not
significant fading by using Linear anntennas on Earth-stations. The voice quality on Downlink is excellent and is
easily approachable, with very Low ERP power.

Hope that helps you. If you need additional infos, just let me know.

73, Mak SV1BSX

Thomas & Mak,
Yes, it did help. Thank you. As I presumed, AO-27 is a non-starter these days. I used to work it 10 years or so ago and remember having a wonderful double "whip" QSO with Roy Soifer when he was in OE land.

Mind you, I still had half a brain in those days ... things have deteriorated in the last 10 years. I shall be demounting the aerial arrays shortly and donating most of the gear to the local radio club ... though only one Ham showed any interest for satellite operating and that was way back on AO-10.

It looks like I'll have to build a satellite myself and shoot it up with some knicker elastic, mind you, those clowns at the Andøya rocket range probably wouldn't appreciate the competition.

They managed to drop a small rocket into Russia 2 years ago and caused quite an international incident.

You can imagine the Russian reaction to the NOGGY ... "Oops, sorry! ... our rocket went slightly off course".

Probably they want to use an "easy sat"!

Even NASA JPL is on this charming campaign? Did the Russian make them aware of their future intents? Probably it is a way to counteract the global warming effect with a reenactment of the cold war...

AMSAT-NA valets just jump on this one...always late again...at midnight minus one second.

Topic: 951 Message: 951

AO-7, orbit 50476 ... there I was, patiently calling CQ with my normal QRP power when the transponder suddenly started going throwing a wobbly! ... (FM-ing).

Somebody was obviously knocking the transponder rotten!.

I had my downlink on 145.942Mhz and found the culprit on 145.951Mhz.

DC7TS talking to another German station, both in JO63PO ... where they could have stuck their heads out of their respective windows and waffled to their heart's content, instead of making the transponder to all intents and purposes totally unusable for everybody else ... particularly those who follow the rules.

Whether this was due to the "mine's bigger than your's" mentality or just plain sheer ignorance of the operating proceedure on AO-7 I don't know, I don't speak German.

However, it does !! illustrate *WHY* national society's in their magazines *SHOULD* make potential satellite operators
aware of the recommendations. Not every satellite has the same operating proceedure.

I've been mentioning this fact on and off for 10 years now but there's been little or no response from the editors of the national societies ... how else does one reach the "new" operators?.

Of course, I tried (politely) to ask DC7TS and friend to QRP by several hundred watts but they probably couldn't even hear my "normal" signal on AO-7.

Possibly another case of a *BIG* transmitting aerial and no receiving aerial ... who knows!.

73 John. <la2qaa@...>

AO-7's orbit 50477 was even worse than the previous one. This time we had something that appeared to be Russian taxi's ??? jockeying for the passband ... maybe they're gearing up for the Sputnik celebrations tomorrow? ... this was while the satellite was over Russia and prior to the passband covering the rest of western Europe.

Later in the pass, F3ZD ... (whom I work almost every day) ... also noticed this QRM.

There has been little activity on the transponder in both modes the last 2 days.

Hi Thomas

I was answering back on this thread to say AMSAT-NA change the AO-51 sked without giving any early warnings and some EU station already have their sked made for at least one a demonstration eg:

That's a shame. I have spent time trying to arrange a contact with the special event station that will be active on the day on AO-51. Will scrap plans to take the station into my school. Now no possibility to have a QSO. Wish I had known this earlier.

Still, will listen and hopefully send a report.

David

AMSAT-NA always told us that AO-51 is an easy sat and that's why some use it but when changing their sked closing down the satellite over the rest of the world the only one explanation Mr Drew KO4MA is giving is "use the other sat available

"> >> SO-50 and VO-52 have passes over the UK at almost the exact same
> >> times....how about one of those satellites?".

The AMSAT-NA way...

P.S i sent the previous message to AMSAT-BB but they censored it... again? and probably this one also...

But for your question "> Would the Sputnik event extended for European participation ? Which QRGs would be used ?

You should ask on AMSAT-BB reflector but you can risk to have some flame back...

> >pretty

How many time on the road we are stuck behind a senior driver who's driving just below the normal minimum speed? The same is true also on the satellite and as the average OM age is around 57 it's quite normal our senior who have plenty of time does not seems to see that some are eager to make a quick one or could be their first one. (Before flaming me i refer to the exception as most of the sat operator of any age a operating correctly)

Its not a complaint but an observer note. Blaming the age is not an excuse for bad operating skills! Did the bad operating practice are coming from HF i answer YES but as LEO satellite are not HF bands and as LEO are available on a very limited period of time, we all rely on the next available local sat operator who should make the culprit aware of the situation.

Before condemning we should be sure the culprits are aware of their acts and if they are and they just follow the same trend we should start a coax cutting rampage before cutting something else...JOKE...

A personal event here. On an ARISS contact someone in my direct range start to call NA1SS on the downlink frequency in the middle of the contact. Fortunately the ARISS station was too far away to be bothered but this fellow was not aware of the procedures or he was simply ignorant just jumping on this long "skip".... I think he was getting the message after the event but i was never been able to get an answer on my questioning?

"-"
P.S. I understand why we are all afraid to become old...including myself!

961. overseas AO-7 Mode-A

Yahoo group: eu-amsat
Date: 2007-10-06 15:15:29 UTC
From: SV1BSX
Topic: 961 Message: 961

Hello all,

a nice QSO took place today @ 11:50Z between Henri, F3ZD and Dan, AJ9K on MODE-A !
Distance JO11FA - EN53EB = 6562 Km.

Good news. I think it's the 1st overseas contact on Mode-A during
this period, where AO-7 is out of eclipse.

Good job from Henri and Dan.

Have a nice weekend

962. RE: Mode-C ?

Yahoo group: eu-amsat
Date: 2007-10-08 09:34:25 UTC
From: John Hackett
Topic: 962 Message: 962

Mak,
You're absolutely right ... the satellite *DID* start in mode-C but changed to mode-B when it came further into the sunlight ... the satellite has been running along the grey line at certain times on certain passes ... not really in eclipse and not completely in sunlight.

This of course affects the transponder.

I *PURPOSELY* made my own entries as mode-B yesterday so as not to completely confuse the newcomer in case he or she has been reading some of the comments on the various pages regarding AO-7 eclipse and modes information.

To understand what is going on with AO-7 one has to read the *ENTIRE* history ... and most people don't do that ... they just assume that if "Joe Bloggs" says it's so and so ... it *MUST* be true ... (which it more often than not isn't!).

73 John. <amsat.org> AO-7 Resource Page Admin:

John, forget it. I have already
corrected it to Mode-B.

It should be very big puzzle if we
starting Mode-B & C.

BTW Mika he didn't entry me on Log, I
don't know why, the QSO was completed... I deleted also him !

However also the next pass was very weak.
Difficult to copy myself on CW.

Subject: Mode-C ?

Hi John,

today afternoon during the usual AO-7's
"good" pass for me, over W.Asia - E.Europe, I was wondering where is the

Satellite!
Nothing till 25 deg. Elevation, but after
a carefully listening on Downlink I heard my CQ-CQ signal, very-very
weak.
After 2-3 mins, Mika OH8MBN he answered me.
For first time it was difficult to copy both signals (Mika's and
mine).
A very strange ECHO also took place, it was also
very difficult the Zero-Beat.
BTW I didn't hear any other on this
pass.

If my receiver and my antenna are both in
good shape, I wonder: was it "Mode-C" ?

My entry in Emily's LOg is as Mode-C. If I am
wrong, please correct it.

963. Your opinion.

Yahoo group: eu-amsat
Date: 2007-10-09 17:52:22 UTC
From: John Hackett
Topic: 963 Message: 963

Hello Al,
On the early passes this morning AO-7 was again creeping along the grey line ... not quite in sunlight, consequently, the transponder was off.

I monitored it as it passed into sunlight ... (according to NOVA).

I noted my downlink started off very weak and became progressively stronger as the satellite moved further into the sunlight.

I would have thought the power from the solar array was either 'ON' or 'OFF' ... depending on sunlight ... not showing slowly "increasing" power ... this suggested that the array was feeding some sort of 'battery' or 'capacitor'.

Is it normal that a solar array needs 'time' to "get up to speed".

As a solar panel guru, I'd be most interested in your opinion here ... I have a sneaking little suspicion that the battery on AO-7 *MAY* be holding some charge in sunlight but dispersing itself under a certain threshold.

Our monitoring two years ago would also suggest this is a possibility, when we copied that good telemetry.

Comments on a 9 quid note to Frei Island ASP.

73 John. <la2qaa@...>

964. AO-7 weak signal.

Yahoo group: eu-amsat

From: John Hackett
Topic: 964 Message: 964

Quoting Mika OH8MBN ... a 6dB difference between mode-B and mode-C wouldn't show the difference between a S7/S9 and a barely audible signal.

Quite right! Mika. I don't think the satellite was in mode-C at all, I believe it was in mode-B ... but creeping along the "grey line" and therefore *NOT* getting enough sunlight to power the transponder properly.

Taking into account the age of the solar panels ... (31 years) ...
it's a safe bet that they are *NOT* producing anywhere near what they did in 1974. It's anybody's guess exactly how many watts the mode-B transponder is producing these days.

I'd estimate that mode-C would be totally inaudible these days unless you were using an EME class receiving system, however, I am open to debate on this particular point. I have been using QRP for 40 years now and am fully aware of what can be done with decent aerials but it should be remembered that AO-7 is *NOT* equipped with a large array when considering my comment re: power.

Mak, Terry,
Mak reports AO-7 as OFF on orbit 50556, 3 minutes later Terry reports it in mode-B.

Presumably, Terry heard his own downlink or he wouldn't have logged on.

There is little doubt that some unusual things are happening lately, just like I predicted several weeks ago ... but unfortunately, my crystal ball has thrown in the towel so unless anyone goes up and checks it out first hand, we can only guess what is really going on.

Now !!! would be the time to have a working beacon.

John,

as you know me, I'm NEVER, never "absolute" about something. I tried dozens times to access the Satellite, without success.
These kind of orbits are excellent for me (AOS over S.Africa, TCA @ 250-260 degr.) At 260 degr I have a high building very close to my QTH, so I am behind of building's shadow between 270-360 Degr.
So I can't say if the AO-7 was "turned-ON" at this period where the Satellite was over C.Europe and our friend Terry has much better access than me.

However, I believe that this time the Satellite was "OFF" from AOS until to TCA (250 degr, time period 17:53-18:03 UTC). Especially over Africa, AO-7 was direct-forward to my "Guns" with 100% clear horizon, so I consider difficult I didn't hear it that.

" I don't put my hand over the fire", but I believe that it was OFF beween AOS-TCA.

I have also this sneaking little suspicion. I could observe, when the 2m beacon was active, that AO-7 was still active after it goes into eclipse for a few minutes.

Another "sneaking little suspicion" from me is: Since the transponders switches again (I mean at 01:36 UTC), the 2m-beacon is offbeat completely.

Mak,
Re AO-7. I don't for one moment doubt you ... like I mentioned to Thomas ... there's a lot more going on up there than we are propably aware of.

We really ought to have a working beacon now ... I mentioned to Thomas, perhaps it might be an idea for the constructors to incorporate a redundancy back-up system for the beacon on future satellites.

Thomas also ! noticed that 2 years ago ... (when the TLM was good) ... the transponder was still operating for a short while into eclipse ... how could it do that if the battery *WASN'T* holding any charge at all.

I must admit, solar panels are *NOT* my forte ... neither are batteries ... Al believes the battery is emulating a large resistor these days ... I'm not so sure. Everything is based on the comment ... "the battery went open circuit" ... but did it ?? ... "good" TLM 2 years ago suggestsmaybe it *DIDN'T*.

Al tells me that solar panels *DO* need a certain time to get "up to speed".

Without valid telemetry we're "bolloxed".

..John, I know that you didn't doubt me, simply I wanted to explain
with much more details.

Honestly, I'm very careful man when I post something unusual. I don't like to confuse others, like
a guy few months ago when the FO-29 was suddenly "OFF", but he reported that again & again:

-"I hear the Satellite! I hear the Satellite Loud & Clear ! FO-29 is alive !"

Finally, he had heard.... a "birdy" on his transceiver!

Madness! If we can't recognise a "birdy" from a
real Satellite, I will go for... fishing !

However the fact is that, AO-7 during the last days it has very ususual behavior.
I hope to comes back again in the previous good shape,

with the usual strong signals, in order to be able to enjoy it without problems for a long time
in the future.

Unfortunately, this moment it's the only one Satellite with a good enough footprint for LEO till the next HEO, even if the P3-Express it's obvious that it's not "Express" anylonger but in practice... P3-D (where D = Delay!), as the launch-day is for once more time deferred
for somewhere between ...2008 - 2010.

Patience my friends ...

Due to it's somewhat erratic behaviour this past week I have been monitoring AO-7 even more closely than usual.

There has been some controversy as to which mode ... B, C or OFF ... AO-7 is in at certain periods in the same orbit.

Here are a few points to ponder.

This is a good opportunity to test your receiving system.

Some stations report the satellite as being OFF when they can't hear their own downlink ... whereas others, at the same time/same orbit report it as being ON but in mode-C ... (low power) ... this is *NOT* a comment on SV1BSX's report of the satellite being OFF ... because I experienced exactly the same thing myself this morning at 11-10-07 at AOS.

AOS ... nothing heard ... (and I gave *GOOD* antennas) ... but soon after the "footprint" crossed the grey line, in both IT and NOVA ... (I was monitoring both) ... my own downlink was audible AND INCREASED PROGRESSIVELY AS THE SATELLITE APPROACHED THE HORIZON (LOS)... that is to say ... the range increased and the signal became stronger.

For obvious reasons, THIS DOES *NOT* SUGGEST MODE-C.

The laws of physics *DON'T* change ... however, propagation and other parameters do. Mode-C.

It is possible that the 30+ year old solar panels are producing enough power to run the transponder at 2 watts since they've been producing adequate power to run the transponder in mode-B ... whatever that power is these days ... (unknown) ... but it's still hyperthetical as to which mode the satellite is actually in at AOS.

If anyone has any coherent explanations please share them with us because once again AO-7 is continuing to dish out surprises and the old girl can teach us all something valuable for future satellites.

NB.

It's interesting to note that when the *footprint* crosses the grey line ... (a phenomenon I've monitored for several days now) ... the solar panels are in full illumination ... (theoretically !!!) ... but the transponder appears to be OFF and switches ON just as the footprint crosses the line.

A coincidence? ... I think not, but I don't have a "sensible" explanation.

Explanations are invited to EU-Amsat.

Hello Mak,
As always ... we're on exactly! the same page.
I experienced the "OFF" mode this morning ... at least until the *FOOTPRINT* !!! crossed the greyline.

This is a phenomenon I *CANNOT* explain ... the panels are (theoretically) in full illumination, only when the "footprint" crosses the line do I hear my own downlink. Strange !!! ... and as the satellite's range increases the signal gets stronger !!!!!!.

The opposite !!! of logical.

I'm beginning to wonder if I've grown senile !!! this last 7 days but then I remember ... AO-7 is a female !!! so maybe it's not surprising that I understand nothing !!!!.

Subject: Re: [eu-amsat] Curiouser and curiouser ... Lewis Carrol.

..John, I know that you didn't doubt me, simply
I wanted to explain
with much more details.

Honestly, I'm very careful man when I post
something unusual. I don't like to confuse others, like
a guy few months ago when the FO-29 was suddenly "OFF",
but he reported that again & again:

-"I hear the Satellite! I hear the
Satellite Loud & Clear ! FO-29 is alive !"

Finally, he had heard.... a "birdy" on his
transceiver!

Madness! If we can't recognise a "birdy" from
a
real Satellite, I will go for... fishing !

However the fact is that, AO-7 during the last days
it has very ususual behavior.

I hope to comes back again in the previous good shape,
with the usual strong signals, in order to be able
to enjoy it without problems for a long time

in the future.

Unfortunately, this moment it's the only one Satellite
with a good enough footprint for LEO
till the next HEO, even if the
P3-Express it's obvious that it's not "Express"
anylonger
but in practice... P3-D (where D =
Delay!), as the launch-day is for once more time deferred
for somewhere between ...2008 - 2010.

Patience my
friends ...

73, Mak SV1BSX

Hello John

Where come the info from, that the solar panels are in full illumination ?
In general if a satellite is sunlit or not has nothing to do with
greyline and sunlight/night on our Earth. This is a widespreaded
mistake. I heard the 2m-beacon from AO-7 also in the night and it was
in full sunlight. I calculate eclipses with James' G3RUH's PLAN-13
software. You can find it here:
http://www.amsat.org/amsat/articles/g3ruh/111.html

There are also programs, which calculates the "visibility" which
indicates, if the satellite is visible by eye. This has also nothing
to do with an illuminated satellite.

I hope, my explanations are correct. This is a very interesting theme
and I'm open for further discussions and corrections.

977. AO-7 Events.

Yahoo group: eu-amsat
Date: 2007-10-11 11:16:13 UTC
From: John Hackett
Topic: 977 Message: 977

Here are the events for the 50576 pass.

08:37 ... AOS but nothing heard from the transponder.
08:38 ... Normally, I would have a strong downlink now but still nothing heard.
08:38:26 Very faint downlink signal.
08:39 ... S3
08:40 ... S3 for the entire pass.

This time we can "assume" the satellite is in mode-C.

Interestingly, once again, the solar array was (theoretically) in full sunlight but the footprint was 90% in darkness at AOS when the transponder is supposedly OFF. I have no logical excplanation for this.

Thomas,
I agree !!! with you. My "information" comes from the tracking program NOVA and Emily's AO-7 Resource Page (which I administrate) and both "claim" AO-7 is sunlit until next April.

I must admit, I'm rather sceptical to this and the last time I mentioned it I was flamed rather dramatically.

Of course, the commonly known (HP operator) Greyline and a satellite orbit usually have very little to do with eachother, I'm fully aware of that ... except in cases like I've mentioned in the last couple of days where AO-7 *concidentally* ??? is coming up at AOS and the footprint is following the Greyline ... this led me to assume that maybe the AO-7 solar panels are *NOT* !!! always fully illumated ... but like I said ... when I first mentioned this a few weeks ago I was shot down in flames from certain people so I decided to keep quiet aboput it ... until several days ago when it seemed to be a little more than mere coincidence.

I need to spend a little more time studying this phenomonen and 'NOT* just relying on what a certain prediction program says.

There *IS* something called "human error" ... I know !!!, I make lots! of mistakes ... that's how I learn.

...yes indeed gentlemen, it's a very interesting theme. I wonder also several times about that.

Thomas, because I'm using NOVA for several years, the "Visible" is always when the satellite is illuminated. Without light, how is possible to be visible? Simply impossible.

Therefore, NOVA has 3 states:

1)Visible (illuminated Satellite)
2)Sun ("" ""
3)Eclispe (NON illuminated Sat)

But I complete agree with: "if a satellite is sunlit or not has nothing to do with greyline and sunlight/night on our Earth".

.. and I remember dozens evening & night's asceding passes of AO-7 from East-South to North during last months,
where the AO-7 was over the dark side of planet's surface, but it was "ON".
However, NOVA always under this case wrote: "Visible" or "Sun".
****

John,

about your note I have to say that:

definitely the latest behavior of AO-7 has to do with Grey-Line's crossing.
I agree. Just I diversify with your note about the crossing-timing of footprint with Grey-Line. I think, the Satellite is "turned-ON" when is about
1000-2000 Km behind of Greyline (over the dark area) and is mooving forward to
the Daylight. At that time, a part of footprint is already into Daylight.

Today evening, I noticed about just the same.
Asceding orbit 50572, 15:55 Z -16:04 nothing heard. Probably was OFF.
At 16:05 Z I heard (suddenly) 2,3 signals on CW, but very weak.

I can't explain also this unusual, strange ECHO on Downlink-signals ! It's always here,
when the Downlink signal is very weak.
(That remembers to me the "HF propagation", when the signal is received from Short & Long path the same time !)

Another observation: it's obvious my Power is not enough anylonger for accessing of AO-7.
I say that because, tonight even if I heard clear somebody to call CQCQ, it was unable to access the Satellite with my 50 Watts ERP in order to answer

to him.
It's obvious that, AO-7 needs much more Uplink Power now.

Desensitization of AO-7's receiver ? Bad power-budget?
I don't know... I have no any comment here.

Mak,
Correct, orbit 50576 ... ACCORDING TO THE AO-7 RESOURCE PAGE LOG.

Remember, the AO-7 Resource page orbit number and the NOVA orbit number are *NOT* the same.

It's rather silly that the software writers use different algrothims for their tracking ... it confuse !!! people.

50576 was the orbit from the AO-7 log. I checked both InstantTRACK and NOVA for the satellite position. I use InstantTRACK for it's ITune facility ... (old rigs, no CAT interface) and NOVA for it's superior graphics. Ther programs don't agree "EXACTLY".

I hope that clears up the confusion Mak.

Well Mak,
I use less than 50w EIRP so there's more to this than meets the eye.

I hope !!!!! I'm wrong when I remind you about the two stations I mentioned 14 days ago with their *EXTREME* power.

One thing's for sure, that kind of power is *NOT* good for AO-7 and could well have "knocked" the satellite into a mode-A/C switching period ... this *IS* possible.

You may remember I did warn a couple of months ago, when I first noticed the imminent changing of the transponder modes about what *could* happen with excessive power abuse.

I fear it has now happened ... though I sincerely hope I am wrong and it's just a passing phase ... (pardon the pun).

Time will tell.

983. RE: AO-7 sleuthing

Yahoo group: eu-amsat
Date: 2007-10-11 18:34:30 UTC
From: John Hackett
Topic: 983 Message: 983

Hello James,
A pleasure to meet you my friend.

Yes, AO-7 *can* be fully illuminated ... (depending on it's position and direction) ... before the ground-based "Greyline" prediction occurs at a particular QTH at AOS.

The opposite can also be true ... you're right !!!, celestial mechanics are very! interesting.

Mode-C is a QRP version of mode-B. Originally with 2 watts from the transponder but that was in 1974 !!!. One can only assume that after 31 years od space dust "decorating" the solar array this power would be rather optimistic ... but that is speculation because recently the old girl was! producing a bit of power in mode-B ... but a lot less in mode-A. Of course, nobody knows the *actual* power because there are so many variables with prediction software/power budget calculating software etc.

You mentioned radio astronomy ... I have the dubious distinction of being born within spitting distance of JODRELL BANK, when I was a kid, the world's largest radio telescope (and the first to command to Sputnik 2) ... so don't let the LA callsign fool you ... I'm a senile old Limey !!! ... ex: Signals c/o Her Majesty's Service ... and ex: NATO ... which is why I ended up on Frei Island, Norway.

I hope you don't mind me putting this on the Amsat-bb, I was asked particularly by several people on your side of the pond to keep "you lot" posted on developements.

My own "theory" is that two alligators several days ago "knocked" AO-7 into a mode-A/C switching sequence.

The "usual" mode-B winter/mode-A summer switching has gone off track ... (I did warn about this several weeks back but got shot down).

As I mentioned preiously, to fully understand AO-7's "case history" one needs to read all of it ... not just selected pieces. It's an interesting story ... and one I'm surprised Amsat have not taken more interest in since there are so many "firsts" for AO-7 and the old girl is *STILL* producing a few surprises.

Have a good day! Jim and thank you for your mail, a pleasure!.

From: SV1BSX
Topic: 974 Message: 986

John,

I was thinking that after your message:

it's strange but I didn't notice any difference the last 3-4 days on Mode-A downlink signal.
Yesterday I had a nice QSO (SSB) with IK0DPX, and because it's not the first time, the Downlink
signal was 55 on both sides - as usual.

So I mean that, I think the Mode-A is unchanged (even if that needs more observation).
But on Mode-B, definitely we have a completely different situation with much more weaker Downlink signals.

BTW about 50 Watts ERP, John you know me well enough, I never used from my side more Power. But now, in order
to have the opportunity to test the Satellite when it seems to be desensitized on Mode-B, I would like to have +3dB above
my usual ERP. Just for test and observation, not for using this Power always.
That was my thought and nothing to do with QRO.

Subject: [eu-amsat] Interesting !!!.

Well Mak,
I use less than 50w EIRP so there's more to this than meets the eye.

I hope !!!!! I'm wrong when I remind you about the two stations I mentioned 14 days ago with their *EXTREME* power.

One thing's for sure, that kind of power is *NOT* good for AO-7 and could well have "knocked" the satellite into a mode-A/C switching period ... this *IS* possible.

You may remember I did warn a couple of months ago, when I first noticed the imminent changing of the transponder modes about what *could* happen with excessive power abuse.

I fear it has now happened ... though I sincerely hope I am wrong and it's just a passing phase ... (pardon the pun).

Time will tell.

...yes indeed gentlemen, it's a very interesting theme. I wonder also several times about that.

Thomas, because I'm using NOVA for several years, the "Visible" is always when the satellite is illuminated. Without light, how is possible to be visible? Simply impossible.

Therefore, NOVA has 3 states:

1)Visible (illuminated Satellite)
2)Sun ("" ""
3)Eclispe (NON illuminated Sat)

But I complete agree with: "if a satellite is sunlit or not has nothing to do with greyline and sunlight/night on our Earth".

.. and I remember dozens evening & night's asceding passes of AO-7 from East-South to North during last months,
where the AO-7 was over the dark side of planet's surface, but it was "ON".
However, NOVA always under this case wrote: "Visible" or "Sun".
****

John,

about your note I have to say that:

definitely the latest behavior of AO-7 has to do with Grey-Line's crossing.
I agree. Just I diversify with your note about the crossing-timing
of footprint with Grey-Line. I think, the Satellite is "turned-ON" when is about
1000-2000 Km behind of Greyline (over the dark area) and is mooving forward to
the Daylight. At that time, a part of footprint is already into Daylight.

Today evening, I noticed about just the same.
Asceding orbit 50572, 15:55 Z -16:04 nothing heard. Probably was OFF.
At 16:05 Z I heard (suddenly) 2,3 signals on CW, but very weak.

I can't explain also this unusual, strange ECHO on Downlink-signals ! It's always here,
when the Downlink signal is very weak.
(That remembers to me the "HF propagation", when the signal is received from Short & Long path the same time !)

Another observation: it's obvious my Power is not enough anylonger for accessing of AO-7.
I say that because, tonight even if I heard clear somebody to call CQCQ, it was unable to access the Satellite with my 50 Watts ERP in order to answer to him.

It's obvious that, AO-7 needs much more Uplink Power now.

Desensitization of AO-7's receiver ? Bad power-budget?
I don't know... I have no any comment here.

987. More on the Greyline theory.

Yahoo group: eu-amsat
Date: 2007-10-11 23:21:19 UTC
From: John Hackett
Topic: 987 Message: 987

Gents,
Don't give up on my "hare-brained" Greyline theory just yet. Remember ... it's not just a "flat" line on the globe we're talking discussing here.

For all intents and purposes "space" is 3 dimensional.

Thomas's point is IMPORTANT ... regarding illumination.

Half of the satellite may be illuminated while the other half isn't, much depends on the attitude in relation to the sun ... but some tracking software doesn't always predict these parameters and those that do hardly ever agree with eachother.

So which is correct? ... don't ask me !!!.

As long as the signals have been "booming" in nobody has bothered much about minor details and possible small perbutations. Now may be the time for a bit more study.

The following is a mail from Ken GW1FKY, with a *VERY* good suggestion for a beacon. I think we should support it ... coupled with my previous suggestion for a redundancy back-up system for a beacon ... it's a great idea.

We are now seeing now just how important the beacon is.

Interestingly, IMHO, AO-7 has taught more people more things about satellite operating than AO-51 ever will.

To: la2qaa@...

Hi John,
Many thanks for your interesting observations and experiences with the operation of AO-7.
I was wondering whether what you stated about the "Footprint " & the "Greyline" information is perhaps the key factor. As we are using software to predict the relative position against what might be the real point that the satellite sees illumination, is it perhaps a factor of error in the modelling that is used?
Just a thought and it would be useful if could confirm the accuracy with future satellites if they had a beacon which did switch on as a result of solar illumination and not as a function of software or a timer.

990. AO-7/A report

Yahoo group: eu-amsat
Date: 2007-10-12 18:54:44 UTC
From: SV1BSX
Topic: 990 Message: 990

Excellent Downlink signal from AO-7 during this evening .
I heard very Loud & Clear Henri, F3ZD with F2IL in a "long-play" CW QSO ~17.00 UTC.
Both signals 559, sometimes peaking upto 599.

The next pass ~17:50 Z was weaker on my receiver, but is still good enough and easily workable
even if nobody answered to my CQ call (CW).

AO-7's transponder in Mode-A seems to be in very good shape.

"I am not fed up with LEO FM repeaters. I am fed up with some operating
pratices"

THE solution you have just to tell them if it is always the same "offenders"

Someone send me a .wav file many years ago of a repeater activated by a tone
burst in EU it was a bit like what we used to hear on 27mhz at that time one
channel too many users that's the Darwin selection theory in his full sense.

Yes a part of the problem are the users but the single channel satellite is the
vector of the sickness...

The same is also true for the transponder type satellite but at a lesser degree

My advice before quitting tell them and tell us all. normally nobody wants to have their name and call sign associated with theses three letters LID.

As a reference you can read my recent post on the thread "Longwindedness" some "senior" or not will have their name and call sign with in bonus some recording posted on internet...If they don't understand by the head they will probably by "CENSORED BY AMSAT-NA..."

"-"

993. Possibly !!!.

Yahoo group: eu-amsat
Date: 2007-10-14 22:39:25 UTC
From: John Hackett
Topic: 993 Message: 993

When I first lanced my greyline "theory" last week to try to explain some of the anomolies we're experiencing on AO-7 mode-B lately while it dragged itself along ther greyline, I was fully expecting to be publicly flogged at the very least, possibly lined up against the nearest wall and shot but at the very least ridiculed and hung out to dry.

Imagine my surprise therefore when several stations actually agreed that this "theory" was a possibility ... my main point ... (in the original mail) ... was that the greyline is actually *NOT* a flat line on the globe to make HF software look good.

(For the "stick-in-the muds", these ovservations are, like the originals that were published in Oscar News and The Amsat Journal, very much "tongue-in-cheek" ... with attempt at making an otherwise boring subject paletable to the potential newcomer ... or ... to alleviate some of the pomposity sometimes found in 'technical' organisations ... yes, I know, the regulars have heard asll this before ... but hopefully, Amsat can still pull in an odd recruit or three.

Long time readers of the original 'Observations from Norway' ... (pre-internet) ... will recall that I always professed to having two (2) activer braincells and that my partner-in-crime, the illustrious GM1SXX ... (hereafter known as "The twisted Pair" ... had three.

However, judging by his latest missive ... (below) ... he now only has two but hey! that's still 1200% more than me since my two have deteriorated to one.

This makes sed GM1SXX 300% ... (you work it out) ... more coherent than I .,.. therefore, I invite ya'll to read GM1SXX's ramblings rather than my own ... (see below).

Anyone being a "sucker" for punishment may peruse our webpage at
<http://www.observations.bix>

I hope this will appease those gentlemen ... (old timers all) ... who requested more of the same.

To the stick-in-the-muds, I profoundly apologise ... though I believe I'm *NOT* treading on anyones toes since the bb professes to be in the land of the free.

I can thoroughly recommend that newcomers read Commander John Brennegan's 'SATGEN' bulletins, archived on our *Observations* site, curtesy of GM1SXX.

With respect.

Ladies & Gentlemen,
The good news is that AO-7's mode-B transponder was "almost" back to normal this morning.

That is to say, signals were *MUCH* stronger than they have been for the last 7 days "outings" in mode-B ... though I did experience some clipping.

Presumably, AO-7 has 'also' been suffering from a bout of influensa ... it being that time of year and all ...

(It's all that spacedust in the bronchial 'tubes'.....GM1SXX).

Of course, it has absolutely nowt! to do with the fact that the old girl was plodding along the "right" side of the blue "Weggie" line.

Hello John

Have you also heard the 2m beacon today ? Also interesting would be,
if AO-7 switches to Mode-A tomorrow.

998. AO-10 question

Yahoo group: eu-amsat
Date: 2007-10-16 13:33:52 UTC
From: SV1BSX
Topic: 998 Message: 998

Hi all,

during last weeks I have read several times that: "AO-10 is semi-operational".

What are they mean "semi-operational" ??? As I know this Satellite
is dead, or occasionally it has a very-very weak beacon when is out of eclipse.
Therefore is non usable for any Amateur radio use.

Even W4SM's "Unofficial" Web Page is without any new update after 2000.

Has anyone on this group any up-to-date info?

I ask because, AO-7 is determined also "semi operational" in the list, but is full
functional in Sunlight.

AO-10 is "semi operational" about what? About the Beacon which needs the.... ARECIBO's dish
in order to be
detectable?

I wonder...

Hello Mak and group

Do they mean the whole satellite is "semi operational" and not only a
transponder ? A transponder or beacon works or it works not. I wonder
also about "semi operational". A report about the whole satelite makes
also no sense, especially about AO-7. It is necessary to workaround the
ANS "Weekly Satellite Report". Also the "Operational OSCAR Satellite Status
Summary" on their homepage is not up-to-date. Its "Updated 9 Apr, 2006".
PLEASE !! Do you read a newspaper from April 2006 ??

To AO-10: After its failure 2002(?) its beacon was heard few times in
the sun, but its transponder was unusable. AO-10 as satellite is DEAD,
not "semi operational".

Dave,
As a moderator of the EU-Amsat reflector I don't appreciate you using it for commercial advertising purposes.

As a Ham, you should know better.

I can assure you that a Primesat controller is *NOT* 'absolutely essential' for aerial alignment, doppler correction etc on *ANY* satellite in ANY orbit ... a "convenience", yes, "absolutely essential?" ....
absolutely not.

There are several (free) programs available to satellite enthusiasts on the internet that already perform the functions you mention ... by using PIC controllers or even simple A/D converters.

I'd aim your advertising towards the other side of the pond
(I noticed you already did) since most of the European satellite operators build their own gear.

Hello Dave,
Well, it's all about the gentleman's agreement within amateur radio ... I assume you know about that ... where amateur radio as a hobby shouldn't be used for commercial gain.

EU-amsat is a site set up for and by amateur radio satellite enthusiasts ... perhaps we have the odd member who doesn't give an F ... (which could also stand for "fig", before you accuse me of being a hippocrite and swearing on the reflector) ... about a gentleman's agreement ... (I'm an old fogey and still believe in such things) ... anyway, as a founding member and moderator of this radio amateur group I have a duty to ensure that members follow normal proceedure.

No offence was intended Dave. Good luck to you and have a nice day. We obviously have a different opinion, lets leave it at that and not start a slanging match like certain of our American friends do when there's a difference of opinion.

On this reflector everyone is welcome to express their views without being flamed.

Topic: 1008 Message: 1008

Mak,
When the power from the solar panels is less than optimum, the satellite's control system starts to send random code from the memory, which will turn the transponders on or off in a predetermined sequence assuming there is enough voltage to control the circuits properly ... BUT !!! ... several factors can and do change the system parameters.

This is what I've been babbling on about all along for several weeks now. At first, everybody assumed I'd gone round the bend ... (mad) ... with my 'Greyline' theory but now, a few people are actually considering the possibility. Unfortunately, I'm not very coherent so I leave the "explaining" to GM1SXX ... where he can do all the work and I can take all the credit ... a 50/50 division of labour.

We have to distinguish between actual fact, that which is wishful thinking and probability.

We can safely assume that the Old Girl's behaviour and mode selection/power output is (indirectly) determined by the solar array ... (read: amount of sunlight) ... and directly by the onboard electronics.

(That was mistake Nr: 1 ... calling a female !!! an "Old Girl").

Your solar panel and my blue weggie theory (*)... (thanks to GM1SXX for providing the "space" name for the Greyline) ... do seem to fit the facts ... even if we can't prove it.

<http://www.observations.biz/Joint_Observations/Observations_14_10_2007.htm>

The onboard electroncs *MAY* be explained after GM1SXX and I have got our thieving little fingers on the original schematics ... (which are still in Washington "as we speak")

(*)

Any self-respecting American knows what a "weggie" is but in this case it's Manchester vernacular for "wedge" and has nowt to do with "cheeks" of any kind.

73 John. <la2qaa@...>
.....

From SV1BSX.

Well John, definitely the "Old-girl" is back again
very Loud the last 2 days.
Last evening I was QRV on Mode/A, the signals was SUPER also on this Mode.
Never I heard it too much strong.

So, I wondering why this "drop down" the last
days.

Have you any idea about the spin of this
Satellite?

I was thinking that, the AO-7 is octagonal. So, the Solar
panels
are numbered No1, No2, No3.... No 8 (each one
on each side of octagonal).

If we have ie the No2, No3 & No4 Panels with
limited Power output and the Spin is Low, may be here
we have the following scenario:

a) when these "limited power
Panels"(No2,3,4) are forward to Sun, the Satellite is very weak due to poor
Power budget.
b) when the rest-good Panels are forward to
Sun, the Satellite is stronger.
.....

That explain partially the mystery, why the
Satellite is a bit stronger when the Satellite is approaching to
the
Daylight.
Simply, the rest "good" Panels help a bit the (low)
Power bugdet even if not straight-forward to the Sunlight.

1010. AO-7 report.

Yahoo group: eu-amsat
Date: 2007-10-17 07:24:28 UTC
From: John Hackett
Topic: 495 Message: 1010

Regular users will have noted that the AO-7 mode-B transponder has begun to "behave" again.

We're still not sure 'exactly' what happened, several "theories" have been bandied about ... what is certain !!! is that it was a power related problem so let us concentrate on *NOT* belting her with excessive power.

When you can't hear yourself adequately ... IMPROVE YOUR RECEIVE CAPABILITIES.

Cranking up your transmit power to compensate for an inadequate receiving system is *NOT* the way to go. Remember ... AO-7 is running at less than optimum in all 4 modes. Let's not accelerate her second demise by screwing up the power budget anymore than it already is.

Excessive power *WILL* shorten the satellite's life. If, through lack of experience you don't understand why ... please take the trouble to find out.

I read on the Internet yesterday one prominent satellite operator, a PA station, list part of his equipment as 100w and 2 x 10 element beams. He specify whether this was 100w EIRP or 100w fed to the aerials ... I most certainly hope it was *NOT* the latter since assuming a line loss of 3dB that would give an EIRP of well over 500 watts with today's compact 10 element beams ... enough to melt the plastic holding AO-7's solar panels on the spaceframe.

(Yes, I'm kidding ... but 500w EIRP is 450 too many for AO-7).

Please remember, 31 years ago not all the "bits n' pieces" were space-rated.

Three things you should improve for better AO-7 operating.

1) Receive capability.
2) Receive capability.
3) Receive capability.

At 06:27 UTC this morning I noticed something I havn't heard for two years ... that which I presume was echos of the BMEWS radar, I was rather "bemused" (pun intentional). It sounded like a rapid machine-gun like auroral woodpecker ... or if you've never experienced aurora propagation, like blowing through your nose into the neck of a glass bottle ... "keying" it at about 65 wpm.

GM1SXX and myself suspected the Fyllingsdale BMEWS radar situated on the north Yorkshire moors in the UK ...

BMEWS = ballistic missile early warning system.

For a detailed description see ...

Hello Dave,
I was born within spitting distance of the JODRELL BANK ... (University of Manchester) ... Radio telescope, in the county of Cheshire, England 1n 1946.

Served in Her Majesty's Service ... (British Army Signals) ... UN service ... (around the world) ... NATO Norway from 1970 until retirement, been here ever since.

Now old, bald and senile ... like AO-7, trying to keep my last surviving brain cell "illuminated".

I appreciate the feedback Dave.

"Observations From Norway" ... (paper format) ... used to be quite popular in Oscar News and The Amsat Journal ... until three heart attacks kinda' knocked the wind out of my sails ... 3 in quick succession tend to give you a message ...
crank it down a notch.

Of course, the "hard" living around the globe had nowt to do with it.

Just came out of hospital again, this time with some plastic tubing in my groin/leg ... I doubt if they did a microwave oven test on it so I expect it's not microwave or space-rated.

The clowns refused !!! to allow me to set up the satellite array in the intensive care unit so I did a runner at the first opportunity ... at a rapid rate of knots ... spoilsports !!!.

You said ...

<Keep all your AO-7 stuff coming .... maybe some of these >kids will get the message.

That is the humble intention Dave. Preferably dressed in a dose of light-hearted humour.

We need to recruit the youth and not have Amsat end up like the two "gentlemen" in the balcony on The Muppet show.

Anybody !!!!! can critcise. "Constructive" criticism is what's needed.

I was under the impression it was already the actual reality...

>Anybody !!!!! can critcise. "Constructive" criticism is what's needed.

Watch yourself as they will put you on their censorship list. This message has been sent to AMSAT-BB too... and at some other e-mail addreses too ;)

>Now old, bald and senile ... like AO-7, trying to keep my last surviving
>braincell "illuminated".

As far you are able to diagnosticate yourself you probably right about the head but there is hope for the rest as selenity will make you unaware of it. Look the AMSAT BOD they are not able to handle any criticism as Smith and Wesson the name of you two old fart (Those in the muppet show i should say...)

"We need to recruit the youth" I attend about 10 hamfests a year and about 4 in the US i don't see any more than a dozen of young folks. I have a 16 year old boy and he wants to be a HAM to be able to have a radio in his car with an antenna!!! He's playing with a CB now but i doubt he will stay around ham radio for 35 years!

For your Hearth condition genetic, smoke, lack of exercise, junk food, obesity are to be taken in account did you? I'm not at 100% even our former Prime Minister Jean Chetien just goes by a 4 hearth bypass operation at 76 and he was in full shape exercising and so on.

I guess you ruin your hearth with too much sex but if i have to choose between a long agony and a rapid way to leave this world i will choose the last option but at the farest date just to be able to comment on AMSAT BOD...

Take care of yourself

PS. I'll bet you 5$ you will not see this one on AMSAT-BB if i loose i send them the money!

Hello Al,
This could explain a lot ... particularly the "series" thing coupled together with Mak's theory of rotating panels that "may" not be 100%.

Of course, there'd be no spacedust deteriorating the panels after 31 years in space.

Do you remember your wet rag and Fairy Liquid test several years ago? ... and if memory serves, that was less than 3 years of accumulated "Paisley" dust.

I havn't been up to AO-7 in the last couple of weeks but I'd bet there's a bit more than your average yellow duster can cope with.

Hi John,

AO7's solar cell strings are series connected and the 'strings' diode protected and connected together in parallel.

You can see in this photo of the rear of two of the eight facets, the bus connections and blocking diodes.

I'm not quite sure of the purpose of the bent metal rods held in place with old chewing gum.

The 'thing' thats bonded to one facet and cabled back to the canon D connector is almost certainly a temperature probe.
You can see the diodes mounted on bare metal brackets near the ends of each facet. They stop lit panels from driving power back into the unlit ones. You pay a price for this... the loss incurred in the volts drop across the diodes, which is why shottky types are generally used.

One very important thing to remember about a series string of cells is that it is only as good as the weakest cell.
If part of the string is in darkness, you lose power from the whole string.

I can prove this easily at home by covering a single cell of my solar panels. If I cover a single cell, the output drops from almost 6 amps in the sun to zero amps.It's important for the spacecraft designer to keep this in mind when designing solar panels.

Lastly.
Panels that are actively sun-pointed work best with plain cover glasses and ones where the sun is usually at a glancing angle (any spin stabilised bird with panels around it) work better with prismatic (ribbed) glass covers. This is because with prisms, more energy hits the active surface. As best I know, AMSAT birds almost all use plain coverslides.

I think Mak might have an interest.

Al.

Al, John & group,
this picture is very-very interesting!

At the point "AO7's solar cell strings are series connected and the 'strings' diode protected and connected together in parallel",
I would like a clear discription.

So what means "solar cell strings are series connected "? We talking here for the all cells of each-one side?

If yes, I agree. If not, I'm a bit ...confused!

73, Mak SV1BSX

> preamp (at the antenna) for years on this reflector.

Certainly Dave, happy to oblige.

First it must be noted, as I've been waffling on about for donkey's! years (Manchester slang = a long! time) that you *DO NOT* have to affluent to have a fully automated satellite station ... (nor does one need to be fully automated) ... that's just a "convenience".

Let me also say, that if I could afford one of the "all singing, all dancing fully automated rigs with a CAT interface, I'd buy one, it's just that I've never been able to afford !!! one. My QRP power levels are not *ONLY* due to my being "sensible" ... (note the parentheses) ... the main reason has always been lack of availabler funds for satellite gear. One of my first "OBSERVATIONS" was entitled "Oscar 13 on a Shoestring" ... I digress.

The radios are the FT-290/790 pair, now well over 20 years old but still providing adequate service. For AO-7's uplink the FT-790 feeds a modified Norwegian Telenor mobile base station amplifier that originally operated on 460Mhz. I hack-sawed off the first two stages, added a 6dB pad, "tweaked" the filter and fed it with 200mW from the 790 to produce 8 watts. I have 6dB of loss at 70cm with the RG-214 coax ... (scrounged from the oil industry installation here) ... so I have an EIRP of about 20 watts from the elliptically polarised home brew 2 x 6el beam. I have never found an elevation rotor to be a necessity.

The 290 for AO-7's downlink is preceeded by a home brew BF981 preamp mounted at the aerial. At 2m an
ultra-low noise gaAsFET preamp in my opinion is not necessary ... due to the inherant sky noise of approximately 2dB at 145Mhz *IN CERTAIN PORTIONS OF THE SKY* ... though at microwave and above, where the sky is quieter, they are a must.

For LEO's, more important than a preamp IMHO is a polarity switcher.

The debate of circular polarisation vis-a-vis ellipticasl can be found on the website ...

<http://www.observations.biz/>

The aerials at ...

<http://www.observations.biz/Observations_from_Norway/Observations_15_04_2007.htm>

... at the bottom of the page.

For AO-7 at 1400-1600Km above the earth you don't need to bother too much about doppler correction but for LEO's like VO-52 that literally streak across the sky some sort of auto-doppler tuning is recommended.

Even newcomers will be aware of the "One True Rule" ... (doppler tuning). This is all very well if you do! have the latest all singing/all dancing rice-box but what do you do if you operate with 20 year old rice boxes that don't have !!! CAT tuning?.

You use a program called InstantTUNE together with InstantTRACK which allows automated doppler tuning using mic pushbutton rigs. Instantune only allows tuning EITHER the uplink or the downlink so if you want to be FULLY automated, you'll need a pair of old 386 IBM's (or equivalent) and a pair of monitorsd from the nearest computer company/school skip.

Everything else I can think of is home brewed and is to be found on the OBSERVATIONS page mentioned earlier.

A couple of useful links are ...

<http://www.observations.biz/Observations_from_Norway/how_much_power_is_enough_pt2.htm>

... which illustrates what can be done with QRP and a shoestring buget.

<http://www.observations.biz/Observations_from_Norway/howmuchpowerisenough.htm>

Self explanitory.

<http://www.planetemily.com/ao7/ao7log.php>

... everything you ever wanted to know about AO-7 is on this site ... I know, cos' I maintain it.
If it's not there, ask me, it'll be in my archives.

You'll find a lot of useful information here ...

<http://groups.yahoo.com/group/eu-amsat/?yguid=188558692>

... and it's all free.

I hope this mail illustrates thast it is possible to operate amateur radio satellites on a shoestring buget. Remember, a *BIG* signal is not necessary a good signal.

Have a nice day, all.

..very interesting that dr Tony !!!

Well, probably you remember me, I had several questions about ITUNE in
order to do it
workable with my vintage V-U, but finally worked just perfect.

After your Email I wonder about "ITUNE.cfg", as I can't see any line
about LPT's ports, just for COM-ports (=serial ports).

Are you using LPTs? If yes, how's that?

Are you changing the values of COMs with new for LPTs ?
( ie LPT1 #378 IRQ=7 & LPT2 #278 IRQ=xx ???)

I would like to have your "ITUNE.cfg" for example !

73, Mak SV1BSX

Hello Tony,
"Takk for siste" (thanks for the last time, as the NOG's say).

Great !! re: Itune being able to tune 2 x rigs using 2 x parallel ports.

Being as *THICK* as 2 short planks I never even considered putting both parallel ports into one PC. GM1SXX is ther "brains" of the team, I'm just the one with the "mouth" who takes the credit.

Actually, two old 386's help warm up the shack in the winter but it *WILL* be nice to cut out at least one of the noisy fans ... sounds a bit like a southbound from Charring Cross on the underground.

Thanks Tony.

Hello Al,
Fish? ... in a barrel !!! ... (AO-7).

More and more people are discovering this satellite.

Will Amsat learn something from this ??.

I very much doubt it ... (honestly, no joke, I sincerely believe they don't see the implications).

I'd write an OBSERVATION for the Amsat-BB but I fear the b.o.d. are already too biased to *NOT* take any notice of the opinion of the people who actually *use* the satellite.

There is a *LOT* of good advertising for AO-7, radio amateurs, space, components, the Amsat organisation (!!!) etc ... if the Amsat b.o.d. had the brains to utilise it ... but I think they see AO-7 as "finished".

73 John.

1029. The devil is in the details

Yahoo group: eu-amsat

From: Luc Leblanc
Topic: 1029 Message: 1029

Excerpt from AMSAT NEWS SERVICE
ANS-301

"The Advanced Communication Package would be a self-contained earth station which could be sent with amateur radio communication teams or delivered to disaster areas for 24/7/365 emergency communications. These teams would be able to point a small dish at a predictable spot in the sky and immediately begin delivering disaster commun-ication support without depending on HF propagation."

Any amateur satellite carrying amateur radio HEO project is good news but is this will be really an amateur radio project or a semi commercial combo package outreach of the vast majority of the "STANDARD" amateur radio stations around the world.

At the first look it seems that we are assisting of the "techkies" teams projects coming back who as we all know are driving AMSAT-NA and some other amsat's at their will. Just remember this famous CC rider saga few months ago!

From a failed military venture to get a ride at any cost (no money involved here) are we assisting in a selective availability amateur satellite radio? where only FEW involved in emergency activities will be granted the privileges to use this satellite?

The devil is in the details and holloween next Wednesday is full of little devils...

I try to find out more details on this past week October AMSAT-NA convention but i'm only getting on theses sites anyone can give me the right ones?

1030. A Christmas wish.

Yahoo group: eu-amsat
Date: 2007-10-29 09:19:53 UTC
From: John Hackett
Topic: 1030 Message: 1030

A Christmas wish.

Most of the people who operate AO-7 are of the opinion that an HEO is most desirable but failing that, an RS-10 type satellite would be on top of the Christmas wish list ... after all, the RS series of satellites had a lot going for them, linear transponders, brilliant receivers, robots ... in my humble opinion, RS-10 was more popular than the entire fleet of Amsat satellites.

Unfortunately, the Soviet space program has changed dramatically, and their amateur satellite program these days only exists in name ... mainly due to the funding problem.

When I was in Saratov (Capotob), a few years ago, the one time main space related industry city was bustling, these days the buildings are delapidated and abandoned. At one time, "foreigners" were not allowed within 20 kilometers of Saratov, just a couple of years ago I wandered all over the place taking pictures and nobody even bothered to ask me what I was doing.

This reflects the current amateur satellite program ... lethargy.

Can we do anything about it?.

Are we interested in doing anything about it?.

We're constantly being asked to "donate" and support American and/or German projects ... sometimes those the
majority *DON*T want and are not interested in.

How about donating to a Russian project that one *DOES* want and *IS* interested in?.

In other words, breathing some life back into the Russian amateur satellite group.

I can tell you, they !!! have a much better chance of securing a launch ... (think about it).

Comments and suggestions are invited.

73 John. <la2qaa@amsat.org>

NB.

Saratov is also associated with Yuri Gagarin ... (as well as my wife).

Who ???..... GM1SXX.

Speaking for myself I am very interested in a HEO satellite and will invest a lot of money into a good antenna tracking systems and the necessary transverters. I plan to start this in February 2008 in anticipation of HEO in 2008 / 2009 / 2010.

We're constantly being asked to "donate" and support American and/or German projects ... sometimes those the
majority *DON*T want and are not interested in.

Simon,
I agree with you, perhaps I should have been more specific, when I referred to projects that the majority didn't want, I was referring to FM single user satellites of the AO-51 genre.

73 John.

OK,

Agreed - but these FM-only sats are an easy solution for some Hams and could be a stepping-stone into other satellites?

Can't wait for HEO, can't wait :-D

Hello Simon and John

Both types have their benefits and penalties. We are experimenters.
This makes our hobby so interesting.

John, I don't know if there is a group of Russian amateurs who can
continue the RS-Sats. The next known satellite with analog-transponder
will be Delfi-C3, see http://www.delfic3.nl/.

Hi Thomas,
Agreed! ... it's only a hobby.

I was merely throwing out a ball to create a debate.

There isn't much doubt that an RS-type satellite would have promoted amateur satellite operating far more than AO-51 and at a *LOT* less of the cost ... at least that is my opinion.

Others may differ ... which one is encouraged to do on this reflector ... without the ungentlemanly comments as seen on certain other reflectors.

The last time I was in Saratov I was unable to locate any Russian Hams interested in amateur satellites.

Radios such as the FT-817 can be easily used for RX, so anything on 2M or 70cms is doable with a decent whip antenna, this is how I got started, I now have a TS-2000.

I fire up my system for a few weeks each year - but it's HEO for me really, P3E looks very interesting. My interest is the technology more than anything else, I have a lot of software I want to write for satellite support.

As far as I can remember there's a chance that P3E may fly in late 2008?

Yes it is. The first Soyuz will launch from Kourou March 2009. But
there is a new chance to ride on an Ariane before this launch. But this
is INOFFICIAL !

Hello Trevor

I meant the Amateur Radio Radio Sputniks until RS-16. This was the last
really HAM Radio Sputnik. After it cames the univerity and commercial (!)
Radio Sputniks. The last, RS-25, is a payload on the Iranian Sinah-1 which
is inactive now. After its deactivation RS-22 was reactivated. Both
are commercial payloads and intruder. I could hear digital downlink
signals if they flew over Moscow. After LOS Moscow the CW beacon switched
on and the rest of the world can only hear the CW beacon with "RS22".
RS22 is not RS-22 but Mozhayets 4. "Radio Sputnik" in modern Russian means
nothing else than "Satellite with transmitter".

Infos about Mozhayets 4 with the correct catalog number:
http://nssdc.gsfc.nasa.gov/database/MasterCatalog?sc=2003-042A
(There are many websites with the wrong catalog number)

If you have other sources about the Radio Sputniks lets us know.

1043. AO-7 mode switching B/C

Yahoo group: eu-amsat
Date: 2007-11-10 22:41:43 UTC
From: mika.siira
Topic: 1043 Message: 1043

Hello folks,

Today I was working AO-7 on orbit #50954 and after about middle of the pass signal level on downlink suddenly dropped lower than it is usually. After that I managed to work F3ZD and K9HF, but signal level stayed rather low. I am wondering if the reason for this is the mode change from B to C, could it be a possible explanation? Signal level was not so extremely low as we experienced few weeks ago but the change was so fast that the mode switching came first to my mind.

Mika, OH8MBN

Hi Mika,

yes right, it happened that also to me several times. We had posted here
this effect and
probably it is that you pointed out, probably the Mode is changing from B to
C
(I have observed very often just the opposite, from C to B).
John, LA2QAA may be he knows more details about this effect.

From: John Hackett
Topic: 1046 Message: 1046

Mika,
I think you'll find Mak is correct ... (he usually is) ... re: the mode switching from B to C.

Careful study of the log shows several strange things - one of them being certain stations who claim to work other stations ... "out of the passband" !!!. Another quirk is the station who totted up points without even turning the rig on.

I am aware of these 'gentlemen' and that s why I suggested a change to the points system a few weeks ago .. but the main concensus of opinion was ... everybody can see who's cheating so just leave it as it is ... which I have done.

The reason I havn't changed the *modes* in the log is because it would confuse a lot of people. There have been instances where certain stations have *NOT* heard their downlink due to inadequate receiving equipment ... if they cannot hear people in mode-B they most certainly won't hear people in mode-C.

It's worth mentioningt that the mode-C 2 watts was 31 years !!!! ago. These days, due to spacedust on the panels and normal component wear and tear it's most probably far less.

You'd need some sophisticated equipment to measure the transponder power output from the ground ... stuff which LA2QAA doesn't have.

Last week, on the Amsat-bb one American station (callsign witheld) complained that he was using 80 watts from a Mirage amp to a 10 element beam in mode-B ... AND COULDN'T HEAR HIMSELF.

(Clown!.....LA2QAA).

As the log shows, I seem to do alright with 5 watts. Unfortunately, this is a bit low for SSB on AO-7 ... (but fine on VO-52).

For those interested .... in a few days time I will be doing some HELLSCREIBER experiments on AO-7 ... (QRP folks).

Field Hell tackles doppler a lot better than other data modes on satellites and only has a 24% duty cycle so it will be interesting to see if we can make it across the pond on this mode.

A mode from the last war (!!!) seems appropriate for an old girl like AO-7.

I'll chuck a message on this reflector when I'm ready to rock n' roll.

To those whom may be interested,
You *DON'T* need expensive equipment for any mode ... at least not until you get up into the Ghz range where 'special' components are needed.

What you do !!! need is (like Mak says) the ham spirit, a little bit of inginuity, a 'dash' of common sense, the intelligence to listen to the experienced and to experiment ... isn't that what it's all about ???.

Just pushing a button on an expensive black box is BORING !!!.

You might as well buy a handie-talkie and try some FM on AO-51.

I fully agree with you John. The "Rock'n'roll" is greater after such
a QSO. But it was a bit difficult. AO-7 was very loud at this moment
and I heard Terry only with R4/S0. I had a headphone on my head and
it was plugged in in a DSP-loudspeaker from bhi, model NES10-2.

My conclusion after many attempts on Mode-A is, you need a 3-element-beam
in minimum for regular SSB-QSOs. For CW a dipole is enough.

From: John Hackett
Topic: 1053 Message: 1053

Spot on !!! Thomas,
You do !!! need a decent aerial for SSB whereas a dipole is adequate for CW. Personally, I use my 20m inverted V sloper, which on 10m (theoretically) produces 4 lobes.

Since I havn't been on HF for a couple of years now I lowered the aerial from 12 meters high to 7 meters high to elevate the directivity of the lobes for satellite use.

The transmitter is a 20 year old FT-290 and the receiver is an Icom IC-730, also well over 20 years old.

No bells and whistles.

NB,

(The 'boasting')

The reason I havn't been on HF for 'yonks' is that I have QRP DXCC's for CW, SSB, RTTY ... after that, you tend to lose interest in the lower frequencies.

... and here are the results of the Norwegian jury ...

(Our dear American friends won't recognise that phrase - but the "Eurovision" crowd will).

After reading all sorts of wierd and wonderful comments on the Amsat-bb re: data modes on analogue satellites - (including SSTV and the infamous "pesky" 31) - I decided to throw caution to the wind and try to jump through the hoop by myself.

Being an AO-7 afficiondo - (look it up in the dictionary!) - the logical choice was AO-7, not least due to it's orbit - (slow doppler) - and mode - downlink lower than uplink - (you'll need to think! about that one).

I set up 2 x 386 machines running MixW V12, 2 instances of ITUNE and the FT-290/790 pair. I'd already built special interfaces to allow me to regulate the audio on both PC's + adequate filtering - audio and RF.

The first thing I noticed was that a pair of EARS (!!!) works better than the "theoretical" one true rule, in practice - especially on modes like RTTY where you have two tones. It's easier to tune in PSK with a single line on the MixW waterfall display. To it's discredit, MixW can't decide which way to go for "auto-tuning" the last few hundred hertz - to it's credit, give it a little kick up the bum - (manual tuning)- and it copies perfectly.

I missed the callsign ... LA2Q something-or-other ... due to QRM ...(just kidding!!!).

(The next bit is "aimed" at the Europeans).

Obviously, most people are *NOT* going to bother to set up for digital on an analogue satellite - which would entail organising both a TX and RX system but it shouldn't be a problem to switch to a digital mode to just TX ... and since I already have a dual system operating ... I would appreciate a report if you hear me. (I'll *ONLY* be on AO-7 mode-B).

Remember !!! ... due to the different QTH's = different rates of doppler !!! ... I will need to "tune-in" on your signal so send your callsign several 'thousand' times.

For those that are absolutely bone idle and can't be bothered to switch to a digital mode it is possible to give me a report on SSB if you hear any "snoring" noises.

Conclusion.

PSK31 does !!! work on the higher frequencies on satellites but it takes a little more practice than just the normal wailing into a microphone emulating a cow in labour.

AAAAAAWWWWWWWLLLLLLLLLLEEERRRRRRRRR ... (swish) ... (swish)

The good news - (for the South Africans, the good gnu's).

If PESKY31 will work on AO-7 it will most certainly work on P3E - and save a lot of bandwidth while it's at it.

It seems we are assisting at a remake of the famous Cybiko era with their point to point link capabilities. Just a bit more sophisticated (second millennium).

It is a good gesture to give computer to third world countries but those who are starving to death in the many Darfur camps and in many other countries will most likely choose for a bowl of rice instead of a cheap computer.

It is exactly a very poor choice as the one AMSAT-NA made when they decide to go for AO-51 a LEO project instead of going for a HEO.. the same bad choice of priority even if the goals are noble.

P.S. I have a Cybiko here and if anyone wants to give it a try just call me.

About the only thing I havn't tried in radio in 40 odd years is EME - but that is entirely due to aerial (and cash) restrictions.

How does a dedicated QRP operator justify an EME array? - it just can't be done on a wet shoelace wrapped around a rusty 6 inch nail ... (though I am of the impression that a lot of satellite operators use this particular configuration on AO-7).

I digress - in the aforementioned 40 odd years, that which still gets my juices cooking is a 'fast' CW QSO on AO-7 with either RW3XL or UA9CS ... in Russian.

Now that's !!! international communication by amateur radio.

The kids ought to watch such a QSO in progress (translated live).

Every bit as interesting as the Jay Leno SMS v CW video on U-Tube and it would probably get a few enquiring minds in gear.

(Ah!, there was !!! a point to his waffling.....GM1SXX).

He's the other half of the "twisted pair" folks ... see -

..no Thomas, he is a GREAT IDIOT because always following the same signal.

If I call CQ ie on 145.940, he send dit-dit-dit on this frequancy. If I jump
to 145.945, he jumps
also to 145.945. If i return again to 145.940, he is also back to 145.940!
It happened dozens-times to me.

Is it that a method to find somebody the downlink signal? How? by
generating QRM on the "top" of some other operator?????

I don't think so.

Cheers

73, Mak SV1BSX

Thomas,
I can assure you the QRM was quite intentional and had nothing to do with "finding his own downlink".

The station concerned is an experienced "contest" operator (according to his website).

I think the problem had more to do with my refusing to answer such bad operating proceedure and ungentlemanly conduct ... (you don't need to "CONTINUINELY" send dit's for several minutes on top of a station calling CQ).

This kind of behaviour just ruins it for everybody - that's why I went QRT.

Hello Gene,
It's been a while, how are you?.

I've answered your question directly "off-list" because it is *NOT* my intention to start WW3 or get into a slanging match as to the quality of another station's operating proceedure.

Like Thomas says, if it's an inexperienced operator there might be an excuse ... but almost all the regulars have operated this particular gentleman on AO-7 so I wouldn't call him inexperienced on satellites.

It's best to put it down to him "having a bad day" and just forget about it ... I have.

As you know, VFO swishers and QRM'ers are most happy when they're getting "ATTENTION" ... therefore it's best to IGNORE them until they get tired of the game and go off to QRM somebody else.

I've always found the best way to combat deliberate QRM is to push that little button that says ... *OFF* ... (which is what I did) ... so they can play to their heart's content ... without disturbing me.

NB.

I'm too old to let such things bother me Gene. Being an 'old fart' has it's advantages ... he he he he he.

Hi John and others on the forum,

can you tell us, who is this "contestman", or how to visit his website?

Should be interesting to find out (for me, at least!)

73! Gennadi ES1RF/ES3RF

OFF ... (which is what I did) ... so they can play to their heart's content ... without disturbing me.

Just to let you know we have someone who blow in his mike for a whole pass on a sat here few weeks ago over me. I QSY and he don't follow me??

Explanations

1-He's an inexperienced ham who want to make some test
2-He's an experienced ham who want to make test
3-He's an experience ham who want just to do deliberate QRM
4-He's an inexperience ham who just want to do deliberate QRM
5-He's at time each of the above and he's an AMSAT-NA member or an AMSAT-BB reader who dislike what i wrote...

Even if some present themself as strong democratic and freedom defender they act as Mr Hambly one day wrote to me:

On 29 Apr 2007 at 14:29, Rick Hambly (W2GPS) wrote:

> Luc,

> W2GPS
> AMSAT LM2232

As you see here in "America" we are very flexible when time come to interpret the sense of democracy and freedom... some a making deliberate QRM some

censorship and some unjustify war...

As most of the actual folks involved in the Ham satellite business are in the seventies and more!!! how do you think the few new-comers who wants to joingned our group think about this gang!!!

Those young folks who are FREELY chatting over the internet for more than a decade now will just look at us as a bunch of conservative old fart where the truth is in their hands.

I crossed posted this one to AMSAT-BB... just look what the female or male censor in chief will do with this one :))

From OBSERVATIONS ... <http://www.observations.biz/>

By LA2QAA & GM1SXX ... This observation by GM1SXX. See also ... "HOW MUCH POWER IS ENOUGH" by LA2QAA.

A *must* read for potential newcomwrs to amateur satellites.
.....
.....
.....

“More power Egor.” - Dr Frankenstein.

Here's a good question from a regular reader.

> Why is it bad to use more power than absolutely necessary when >transmitting to a satellite and how does this affect the battery >capacity of the satellite?

There are two answers to this one.

1) With an FM bird, power is not an issue. FM is a continuous duty mode. When a signal is present on the transponder, no matter whether you are whispering or yelling, the power consumed is, or should be, exactly the same.
FM transponders operate in Class C. With Class C amplifiers, when a signal is present, the transponder consumes what would be considered a 'normal' amount of power.
With no signal present, the power amplifier (PA) consumes virtually no power, and since the PA is *the* major power consumer on a satellite, this is good. Only the receiver and IF strip are active with no signal present. Power consumed from the battery therefore depends primarily on how much time the transponder is active for during each orbit.

OK, I've neglected the other power consumers on the bird such as the command system etc, but these are NOT affected by the behaviour of users.

2A) With a LINEAR transponder bird, running excess power on the uplink is a VERY serious issue.

On a LINEAR transponder, the transponder's bandwidth (typically 100Khz) is 'shared' between the all of the users users in the transponder's 'passband'. The transponder literally takes a chunk of spectrum, amplifies and re-transmits it's entire contents on a different frequency.

The total transponder power available is therefore SHARED between the users. If one user runs excessive power, the automatic gain control (AGC) in the satellite's receiver reduces the overall passband gain to compensate. This reduces the strength of the downlink signal for EVERYONE.

It's therefore easy to realise that if everyone ran the MINIMUM uplink power, the satellite AGC would never be operating and therefore the DOWNLINK signals (for everyone) would be strongest.

This is an important point.

If the power level of even ONE user is greater than the AGC range can cope with (all too common I'm afraid), the transponder 'limits' (bottoms out), and in extreme cases goes non-linear with the excessively strong signals 'FM modulating' it. In short, it consumes a great deal of power while NOT providing any useful communications.

2B) Now for the serious stuff.
Linear transponders operate in Class AB. The power consumption of the transponder is roughly proportional to the strength of ALL the signals in the passband. If one signal dominates, it will use most of the available downlink power, If it's strong enough to trigger the AGC into action, this lowers the downlink power available for EVERYONE ... INCLUDING the offending station.

So, with a linear bird, the amount of power consumed from the battery is heavily dependent of the strength of the strongest signal!

You may be interested to hear that 5W is enough power (to a modest yagi) to work CW on Amsat Oscar7. It was certainly also the case for the sadly now defunct Russian radiosport satellites.

Satellite receivers are generally VERY sensitive indeed. The limiting factor with Linear birds is the IQ of the most thoughtless user. Many users are sensible, but it only takes ONE user running excessive power into a linear transponder bird to ruin the party for all.

Since the power consumption of a linear satellite bears an almost linear relationship to the total power in the passband, the use of excessive power will rapidly run down the battery. This compromises the expected lifespan of the satellite by degrading the battery components.

Satellites in Low Earth Orbit have brutal demands made of their batteries. 14 orbits a day is typical for these birds, so the battery suffers 14 charge-discharge cycles each day. Try doing that to a set of Ni-Cd batteries and see how long they last!
Because the operating regime is so harsh, the batteries need to be over-rated , in order to provide an acceptable battery life expectancy. Battery Charge Regulators (BCR's) also help greatly to provide an acceptable working life for amateur satellites.

Put simply, here are some basic satellite facts

FM satellites
PRO's.
Can be used with cheap FM equipment.
CONS
Encourages bad operating practices thanks to FM Capture Effect.
Only supports one QSO.

Linear satellites
PRO's.
Can support many concurrent users AND modes.
CON's.

Easily 'clobbered' by FM type operating practices.

So the operating practices for linear and FM satellites are very different. Unfortunately some users don't realise this.

Press Release

AMSAT groups support ZEL funding

Earlier this year the Directors of AMSAT-DL were informed by the University of Marburg in Germany that it had been decided that funding for the ZEL by the University would cease at the end of 2007. The Directors approached AMSAT-NA and AMSAT-UK for financial assistance in keeping the ZEL open for another year. The sum of 25,000 Euros was requested.

At recent meetings of the AMSAT-NA Board and of the AMSAT-UK Committee, it was agreed that both would contribute to the donation. Given the relative sizes of the two donating AMSAT groups it was agreed that AMSAT-NA would donate 75% of the money required, and that AMSAT-UK would donate 25%.

The ZEL (Zentrales Entwicklungslabor fur electronic, roughly translated as the Central Development Laboratory for Electronics) has been the facility which, over the last 40 years, has been at the centre of much amateur satellite development activity by members of the University, members of AMSAT-DL, as well as other members of AMSAT from outside Germany. The most famous satellite to be produced there was OSCAR-13 which gave the Amateur Radio Community many years of excellent service.

Currently under construction is Phase 3E, a satellite similar in size and shape to OSCAR-13, but with many advanced features. It will carry a 70 cms to 2 metre band transponder, as well as transponders on other bands. Importantly it will carry its own rocket motor which will boost its orbit into a highly elliptical one, which will give world wide coverage, allowing ordinary radio amateur great DX possibilities through the transponders. Radio Amateurs have not had such a satellite since the demise of AO-40 in March 2004.

The P3E satellite is still under construction in the ZEL, and its completion is anticipated for sometime in 2008. It is note worthy that some of the personnel employed by the University to work in the ZEL have undertaken to continue working on P3E as volunteers.

Hello Mak and group

The ZEL has developed electronics for the Phillipps-University which was
not available on the market. I think, this is not necessary today. That's
why they closes the lab. And now a year later for AMSAT-DL and P3E.

There was a note from John, that Hartmut has joined our group. Eventually
can you give us a more exact explanation ?

1072. Yaesu G-550 KT-550 rotor freezing and jamming

Yahoo group: eu-amsat
Date: 2007-11-24 17:11:54 UTC
From: Luc Leblanc
Topic: 1072 Message: 1072

This question is intended for part of the world who have below freezing point WX. I have an elevation rotor the Yeasu G-550 installed up side down but who work 2 winters seasons here. This year he just start to freeze and he stuck under minus 0C temperature?

Just before having to dismantle about 6 beams on the boom did anyone experienced this problem? As it seems this rotor has no draining holes i just think to add one to let the excess humidity to get out of the casing hoping the next above freezing point period will melt the ice build-up allowing water to drain out of the rotor casing.

Thank's for your input before i start drilling in the case...:)

Hi Luck,

as I see, nobody answered to your question, so I decide to write you just my opinion -
no experience here in Greece with minus temp's.

But, if my rotator was "glued"(stuck), the first thing that I would try is the measurement of current that
it consumes. The normal consumption should be well known ie from "G-550 manual".

Therefore, if you have much bigger current consumption under 0 C, probably that means the gear-box
is stuck, the motor is trying to move the glued-mechanism, so it's normal the bigger current.

But is also possible to measure 0 Amps. In this case the problem it might be not the
stuck gear box, but something in the electrical circuit (the motor ?).

In any case I don't agree with any new hole on rotor's case. I don't believe that it will resolve the problem.
The internal world of rotator is very difficult (at my opinion) to have too much ice from the humidity, in order to be able to STOP the rotator.
The motor is strong enough.

So, for me it's very important to know the current consumption. That it will help to find the
problem's source.

Just my "2 cents" worth.

1074. The solution.

Yahoo group: eu-amsat
Date: 2007-11-25 06:53:34 UTC
From: John Hackett
Topic: 1072 Message: 1074

Luc,
Having often operated from the eastern part of Norway for many years with as daily temperature of minus 35 degrees in February - I have a little 'experience' from cold climates.

(Incidentally, I used the same rotor).

The long term solution is to change the grease to one that can tolerate the temperature and to mount a "motor warmer".

I used the heating element from a kettle. It keeps the rotor nice and warm in the winter ... but increases your electricity bill ...
horses for courses ...

I CC'd this to the amsat-bb in case there are a few up in Washington State with the same dilemma.

Luc,

as John said, grease is very significant.
I found some interesting Emails about it. Take a look.

73, Mak SV1BSX

==========
==========>>>>>>>>>>>>>>>>>>>>

From Fred, ZL1BYP:
(Second email)

The grease I used was a silicone lubricant called Molykote 111 from Dow Corning. I picked it up - a 100gm tube - at a local engineering outlet. It's designed as a fluid valve and O Ring lubricant and it's appeal to me was that it was resistant to 'washout'. That was the important thing in my book as the bearings themselves are - to say the least - pretty crude as ball races go. There is no specialised bearing grease - to my knowledge - designed for the bearing surfaces involved in these units. Molykote 111 was reasonably slippery - and it would stay there - what more does one need in that situation?!

I can't comment in detail on how well it's done as I haven't had cause to take either of the two rotor sets down for examination or repair. They just run on. Perhaps that says it all.....!!!

First email from Fred:

For what it's worth. I stripped my Kempro rotor sets about 6 years ago and found that the balls had corroded leaving a large ridge on one particular ball. This had 'picked up' a spider finger and it was in the process of using the spider unit as a scraper which was scraping away the groove in the aluminium casing. It was the grunching of this that alerted me to the trouble. With the rotor above the shack window I heard the change in noise immediately and stopped it straight away! (As a marine engineer of some 40 years standing any slight change of sound 'in the ship' is noticed immediately and looked into.....!!!!)

I ditched both of the (very crude) spiders in the rotor and made up the difference in (stainless) steel balls leaving about a "one ball" (5/16") gap so they could roll easily in the track. It's been running very nicely ever since.

I picked up a retirement job at a local university at about the same time and it involved some experimental work using PoSAT on its commercial frequency bands. I did the same thing to the rotor set there before I put it up and that set tracked every pass (using KCTetc.) 24/365 for 4 years (!!) - less a 48hr shutdown when a disc drive failed in the PC - and that's still running beautifully now locked - for the hell of it - on AO-51. (Keep 'em active is the way to keep 'em servicable in my book).

Stainless socket head cap screws is also 'spot on' as replacements for the (dreadful) cross slot case securing screws.

Use plenty of antiseize compound on the threads and - yes - keep the drain hole clear in the bottom of the casing; most important.
****

From John, KC8ZFN (including exchange with Stan, WA1ECF) :

Stan,
Thanks for the tips. From Ken's pictures it does appear that moisture is getting in form the top of the el rotor where the two casing halves meet. I like your lapping for better fit idea.

I think Permatex "form-a-gasket" would not introduce much spread between the halves, but I'm glad you made that point.

I like the idea of tapping grease nipples at the bearings. Anti seize is in order too as you say.

I've yet to get my hands on the G5500 bought in unused condition from a list member, but before it goes up it will be disassembled and treated to some Boeshield T-9 on the inside of the casing and perhaps an enlarged drain hole with a screen cover to keep critters out. I'll follow your suggestions too. That pic of Kens is scary!!

(Stan's email which prompted above reply regarding John's comment "...separate the housings and apply some Permatex gasket sealant."

UGH.... Wrong direction to take

The case halves are precision machined to allow a proper mating of the ball bearing surfaces. adding a gasket will open up the bearings to allow a sloppier fit and greater opportunity to leak inside.

Adding gasket cement to the case halves would make it very difficult to open up later for service.

If anything, I would inspect and if needed, lightly lap the case half mating surfaces to allow a better (tighter) fit around the circumference and grease the case halve mating surfaces with a tenacious grease.

Keep in mind that the drain hole in the bottom of the case is there for a purpose, and may need to be periodically cleared of insects.

Fabricating a cover over the el rotator would do more to keep the rain and dust out of the bearings.

In time, the steel ball bearings and race rust away. The bearings become elongated and do not roll. As the bearings become loose, the gear train unmeshes so the pot is not connected for a el indication or is intermittent. The corroded, rusty, gritty abrasive, bearings start chewing up the softer alloy case halves at the bearing.

An interim solution would be to replace the steel bearings with stainless steel ones and eliminate the bent sheet metal race (bearing separator), adding more bearings to compensate, as needed.

The long term solution is a seal on each bearing surface to keep the acid rain out and to add a grease nipple at each bearing to allow periodic maintenance.

On a new unit, all hardware should be removed, one at a time and a antiseize compound used on the threads to allow maintenance later. Avoid excessive compound in blind holes that may hydrostatically lock the screw. See the folks at the auto parts store.

If you use the separation kit, treat those threads also. The separation kit rusts up in a hurry so use a tenacious lubricating grease on the threads "that will be used". You will see the advantage 5 years from now. I use a 1 lb tub of boat trailer bearing grease from Wal-Mart, will last 5+ years. Use an acid brush to apply.

Use a dielectric silicone grease on the connector pins and backshell before you seal it up with coax seal and tape. This grease is available from auto part stores.
****

From Nicolaus Sallay, PP8DA

I strongly recomend not to use lithium grease, because this mixes with water and looses its greasing ablity. I recomend a grease with molibdenium dissulfite, comecialy known as Molicote or similar brand name. It has excelent lubricating quality's and is long lasting and even in lot temperature conditions it still works. It seems to me that the dark, black colored grease originally used in the rotors are of the above tipe.

Beware of clogging the botom drain hole of the rotor.

Luc,
Having often operated from the eastern part of Norway for many years with as daily temperature of minus 35 degrees in February - I have a little 'experience' from cold climates.

(Incidentally, I used the same rotor).

The long term solution is to change the grease to one that can tolerate the temperature and to mount a "motor warmer".

I used the heating element from a kettle. It keeps the rotor nice and warm in the winter
... but increases your electricity bill ...
horses for courses ...

I CC'd this to the amsat-bb in case there are a few up in Washington State with the same dilemma.

Subject: [eu-amsat] Yaesu G-550 KT-550 rotor freezing and jamming

This question is intended for part of the world who have below freezing point WX. I have an elevation rotor the Yeasu G-550 installed up side down but who work 2 winters seasons here. This year he just start to freeze and he stuck under minus 0C temperature?

Just before having to dismantle about 6 beams on the boom did anyone experienced this problem? As it seems this rotor has no draining holes i just think to add one to let the excess humidity to get out of the casing hoping the next above freezing point period will melt the ice build-up allowing water to drain out of the rotor casing.

Thank's for your input before i start drilling in the case...:)

Many Thank's Mak

Our outside temperature is now +1C and the rotor is working it is confirm water in in the casing and probably gets in by the drain hole that i never found on my unit and if there is any he will be at the top offering a very good moisture access point. Is it also possible that humidity succeed to form inside by temperature variation and or by entering by the joingning sections.

My model a Yaesu G-550 looks like the same as the Kenpro KR-500 and does not seems to have any drainage hole in the casing but this will have to be visually confirm.

Looking at the exploded inside schematic picture of the rotor it seems that it is possible to drill a hole in the casing to drain this excess water? Could be someone who open one can confirm if there is enough clearance to avoid drilling through the gear/motor system?

Thank's for all your advices and for all the private one too.

Hello Luc,

I found your question may be too late to give you any recommendation

regarding to G-550.

I am using G-500A (which is practically the same construction) since

1997 and another one since 1999. And I never (!) got problem, like you have.

For information, here, in Estonia, we have temperature up to - (minus) 32

degrees Celsius in February, so I was afraid about freezing my YAESU rotors (both, G-1000SDX and G-500A).

But it never happened! And they are both very heavy loaded. Just look on my WEB-site!

Main reason - G-500A has a drain hole in the bottom (from the factory!) and it should be open always!!

You write "the Yeasu G-550 installed up side down"!

May be this is a fault, for sure!

I think you can try solve problem just to drill one or 2 holes in the bottom of rotor, then heat with a industrial

air heater untill all liquid flows out and after that never close these holes.

One trick, which I using always, when temperature goes down below -8-10 degrees:

turn the elevation rotor 90 degrees up and when to the parking position.

It helps a lot, even some humidity stored inside the rotor!

Also check, if you have normal voltage on the rotor terminal (the control cable has

thick enough wires).

I hope, you already solve the problem.

Hello to all,

Gennadi pointed-out : "G-550 installed up side down" !

Sorry Luc, I had missed this very important detail (good one Genna)!!
So here we have now a completely different scenario and of course
I also agree 100% with Gennadi, probably that is your problem.
But if you drill 1-2 new holes in the case's bottom, I think
you must "tap" (close) the upper old-hole.
I can't imagine how can be useful the "upper" hole, except an
damned-way to flow water... inside of rotor !

>
End of soap show

Thank's again Gennadi and Dave for your inputs Eagle as landed!!! I finally get through the rotor casing with a 3/16 drill bit and just before i found "the drain hole" exactly where you tell Gennadi "NEVER INSTALLED THESES ROTOR WITH THE DRAIN HOLE UPWARDS..."

As soon as the drill bit pass through the casing there was a fluid leakage who stay flowing in a steady jet for 10 seconds!! and dripping for another 10 seconds with the aid of a metal wire inserted in the hole.

Collateral damages

1-Probably a mess inside? rust? corrosion? mildew? and so on...
2-Upper hole plugged with a metal screw plus silicone
3-Struck something when drilling pass through the casing!!! (Not too lucky with lotto ticket...)

4-Meter does not move anymore probably a wire cut or the pot has been stabbed

Lets the weather return to the minus 0C again and just watch the rotor

Conclusion

Rotor will don't freeze in ice anymore (i hope) and i will have to rely on a visual metering system in daylight and on something else overnight.

Thank's to my neighbour dog a Labrador moaning and barking after me at the end of his chain during the whole operation... Just forget my pliers and screw-driver down the tower!!! as i am not too lucky with my drilling probably the same with my pitching...JOKE ;)

As we can pass in an episode of minus zero C temperature at any moment i don't take any chance and i jump on this +C swing i just remember a past winter with another rotor stuck as water fill in due to a crack in the casing not too happy to have a beam always pointing towards nowhere.

To be continued...

To whom it may concern,

Newcomers to amateur satellite operating.

It's people like LA7SP dishing out false information who frighten off quite a few potential newcomers ...

In an internet article he states ...

Minimumskrav til antenner ansees å være kryss-yagi med ca. 10
dB gain, faset for høyredreid sirkulær polarisasjon.

Translation.

The minimum requirement is a crossed yagi with 10dB gain phased for circular polarisation.

Minimum requirement ???.

(ABSOLUTE RUBBISH !!! ..... LA2QAA & GM1SXX).

(aka . "The Twisted Pair").

This gentleman may think he's being helpful but in fact false information is more of a hindrance than a help to the newcomer.

Once learned, false information and bad habits are hard to "unlearn".

John,

The article must have been written nearly a decade ago.

With regard to "RS" I'm presume you're refering to the section titled "Satellittkj?ring p? HF", he makes no reference to power or antenna gain regarding those sats.

Trevor,
As experienced operators both you and I know that ... however, a lot of newcomers tend to read old articles and apply those principles to today's standards ... which is not always wise.

My intention was to make the newcomer aware of this, perhaps I should have been more specific.

Thank you for pointing out my shortcomings.

John,

The article must have been written nearly a decade ago.

With regard to "RS" I'm presume you're refering to the section titled

"Satellittkjøring på HF", he makes no reference to power or antenna gain

regarding those sats.

1088. 80 watt BRICK on AO-7.

Yahoo group: eu-amsat
Date: 2007-11-27 19:42:57 UTC
From: John Hackett
Topic: 1088 Message: 1088

Trevor,
A few weeks ago I also pointed out that the American who claimed on the Amsat-bb that an 80 watt BRICK amplifier was necessary to operate AO-7 was giving out information that wasn't correct.

The intention was to dispel a few myths.

Personally, I do quite nicely with 22 year old rigs and an ERP of 25 watts - as a quick shuftie at the AO-7 log will show.

The IOTA 36 can't be credited because I never mention it.

With 80 watts you could use the proverbial wet shoelace or a rusty 6 inch nail as an aerial.

73 John. <la2qaa@...>

No offence to Norwegian speakers on this reflector but realistically no-one outside Norway reads Norwegian.

It's not in English (or Spanish/German/Portugese) so nobody in the outside world will ever know about it.

I don't disagree with you John.

Different satellites require different power levels and the problem as you rightly identify is in educating users of that fact.

One recent satellite took close to a Kilowatt on 28 MHz to access it but with many others just 10 watts to a small beam is all that is required.

1091. Norwegians in the minority.

Yahoo group: eu-amsat
Date: 2007-11-28 01:30:06 UTC
From: John Hackett
Topic: 1083 Message: 1091

Trevor,
As I explained in my third mail to you, my comments were merely an illustration - should they not apply to Norwegian operators as well?, minority or not.

Three of them live on this island.

Of course the Norwegians are are minor group, Amsat-wise - does this mean they should be exempt?.

Lets just say you're right and I'm wrong and leave the nitpicking to something more important eh?.

1092. AO-13

Yahoo group: eu-amsat
Date: 2007-11-28 01:55:17 UTC
From: John Hackett
Topic: 1092 Message: 1092

Trevor,
By the way, reference my comments regarding the LA's information where you mentioned he specified AO-13 in a (semi) high earth orbit.

I have a veritable stack of QSL's from all over the world using 25 watts ERP and ancient equipment so the 'specific' aerial and rigs he mentioned are also *NOT* necessary items.

That was the word I reacted to ... "necessary".

Some of the things he mentioned could be 'advantagious' but most certainly! not "necessary"

You see quite a lot of this sort of thing on the Amsat-bb ... kind of like - If it was in "The News Of The World" it *MUST* be true ... (not).

I really do believe a lot of potential newcomers are frightened away by misleading information - particularly the cost of equipment ... a *LOT* of which is *NOT* necessary.

How many time have we read about "you really need automatic doppler tuning" ... a convenience! yes ... but you don't 'NEED' it.

Neither does one need an EME class aerial to work the current crop of satellites ... for instance we ought to make known the difference in the required effect to work a satellite near the horizon vis-a-vis one at TCA - (time of closest approach) - yes, I know you !!! know what TCA means but perhaps somebody reading this doesn't.

I've written an article in OBSERVATIONS suggesting that operators might like to try QRP'ing as a particular satellite approaches them.
A few of them just might get a surprise.

Stop whinging! ...

No DX you say ... have a look at the AO-7 orbit 51201 on Friday the 30th of November 2007 from 05:55 to 06:00.

This orbit covered more sixty !!! entities (DXCC countries) including northeast China, Mongolia, northern India, Pakistan, Afghanistan,
all 18 of the earlier Soviet republics, the entire European continent, the entire Middle East and most of the central and north African countries.

No DX? ... Rubbish !!!.

I battet this over to the Amsat-bb so our American friends can see what "can" be worked from Europe.

I'm sure certain orbits would allow most of the states and even parts of central America on some orbit (?) ... I'm just too bone-idle to check it out.

1095. Symbian prediction software

Yahoo group: eu-amsat
Date: 2007-11-30 07:31:49 UTC
From: John Hackett
Topic: 1095 Message: 1095

To whom it may concern,

A portable satellite station can be as small and simple as a dual-mode handheld plus a 3/4 wave whip - (AO-51).

It isn't always convenient to lug a laptop around but almost everybody carries a mobile phone in their pocket.

Pass prediction programs are available for Windows mobile and certain PDA devices but none - (that I can assertain) - for the Symbian series 60 operating system ... of which there are a*LOT*.

Now, if you happen to be a"wapper" - (pun intentional) - you can get online predictions from the internet - but it's an inconvenient and "finnicky" way of doing things.

Is there anyone out there capabable of writing a pass prediction program for the Symbian series 60 mobile phone operating system?.

(NB - not everybody has the "latest" phone, that's why the Series 60 would be the best option for a Symbian system).

The program doesn't need to have fancy graphics and logos, those are just a waste of space - (again, pun intentional) - a simple prediction table would suffice - showing date, time azimuth, elevation and range. The other criteria are not necessary when you're operating portable.

I did suggest this to Emily N1DID a couple of year ago but nothing came of it.

If anyone is capable - (and willing) - to write such a program I would be *MOST* interested.

Surely it's cheaper to write a Symbian program than to buy a new phone that uses existing software ... like the Predict program on Windows mobile ?.

Anyone willing to take up the challenge? ... (to save me purchasing a new phone).

Topic: 1094 Message: 1096

Good morning John & Group,

you have absolutely right about DXing and AO-7. My location is a mere example, it's in very good position for orbits over West & Middle Asia. Africa too.

However, the Satellite traffic above these areas is very poor.

Except of some former Soviet-Union countries (but just a few), the rest Asia is like a Ham-desert. I have sent several times Emails, for example to Indian hams requesting a sked in order to make a contact with VU. Nothing at all ! And keep in mind, VU-land is a new-one for me on Satellites - but "NO luck" ! (..and my surspise is big enough especially with VU, as this country has in orbit a HAM Satellite - see VO-52)!

I don't know if the Afganistan & Pakistan have anyone active on Sats. I don't think so. Also the Middle East, just a few peoples they are active, I remember the 4X & OD-lands.

Africa? he he.... here is the real desert ! TR8CA was active, but he is not anylonger. ZS-land has several peoples, but never I heard somebody on AO-7. And it's a real DX that for me, over 7000 Km !

Therefore, I agree with your comment however I'm thinking:

"too much DXCC entities but.... just a few peoples" !!!

Ironically, the 1/4 of planet seems to be without population !

Q: could be the EU-AmSat Group the campaign leader (with Emails etc), in order to activate some peoples from these countries on AO-7 ?

It's a good challenge, I think.

Have a nice day

1097. AO-7 Report.

Yahoo group: eu-amsat
Date: 2007-11-30 10:33:37 UTC
From: John Hackett
Topic: 1097 Message: 1097

I wonder how many people make the mistake of thinking AO-7 is not transmitting (when it is) but the receiving equipment isn't adequate.

An illustration ... on orbit 51203 at 09:32 this morning, 30-11-07 at the start of the orbit I heard nothing at all ... absolutely nothing! from AO-7.

However, switching the polarisation of my aerials to vertical (from horizontal) resulted in a received signal of S3 ... and as the orbit progressed, the signal strength incread and the polarisation changed another two times on that particular orbit.

Remember !!! ... the propagation to all intents and purposes is different at various QTH's ... so the result at one QTH - (for instance, signal report) - is highly likely to be quite different at another QTH.

I would advise using your EARS !!! as a reference because meters are a complete waste of time in this particular situation/application.

I would thoroughly recommend switchable polarisation for LEO's. It doesn't have to be commercial and expensive. Mine doesn't even use coaxial relays - and it's built into an aluminium lunchbox ... don't laugh!, they're cheap and RF tight.

There's a full explanation on OBSERVATIONS ... (http://www.observations.biz) of why I don't bother with circular polarisation on LEO satellites.

Gents,

I suggest each and every one of us sends the relavant mail to every national society requesting it be published in their magazine/newsletter to attempt to generate satellite interest in the countries where there is coverage but no operation.

There are several countries where a potential newcomer could "rake-in" the satellite certificates quicker than you can say "AO-7 is a damned good satellite when it's used properly".

Again, I've batted this over to the States in case they suffer from the same kind of inactivity in some of the states.

Let's educate! a few new operators ... not blind 'em with science.

1099. Re[2]: [eu-amsat] Satellite DX

Yahoo group: eu-amsat
Date: 2007-11-30 15:39:14 UTC
From: Gennadi Klevtsov
Topic: 1094 Message: 1099

Hello John, Makis and the group.

The main thing: not only DX, but other HAM-people simply not interesting

in satellite communication via LEO satellites! This is just my opinion,

but look like I am right. Even here, in Estonia i can not "heat up" any

interest to satellites. I make several lectures on our local conferences,

I shows on our hamfests the live QSO via satellites using the portable setup.

All in vain....

Now I am a holder of DXCC Satellite Award (#296) and I was very proud to inform

my Estonian HAM-colleagues about that. But looking for theirs reaction I understood,

that it is the 1-st and the last DXCC Satellite Award in Estonia,

where VHF and up are very popular! I spent 10 years to get these countries via

satellites, but I-ve got my 5 Band DXCC Award just in 5-6 years. Big difference!!

I am afraid to say to some "normal" HAM about 10 years for simple DXCC Award.

They will laugh for the rest of the life...

On my home page http://es1rf.interval.ee I have my DXCC country list,

where are indicated DXCC-land regarding to satellites.

Also you can see, how many QSO with every country and how many of themes are CFM.

From these 119 DXCC territories I've got 108 via HEO satellites

and only 11 via LEO satellites.

From these 11 I,ve got 6 via FM satellites and 5 via linear transponders

(FO-20, FO-29, AO-7).

And this is from 3843 QSO, which I keep in my electronic logbook.

The communication on HF is so easy with a modern RIG and it is possible with

a simplest wire antennas. As one HAM told me in a conversation on 20 m band:

"I am not so stupid to buy expensive VHF/UHF equipment and build up fantastic

antennas with azimuthal and elevation rotators just to make QSO on several hundred

kilometers!". What to say against off?

No enthusiasts, no interest - no newcomers on satellite bands!!!

I am sorry, but me, personally, will never send any

"...relavant mail to every national society requesting it be published in their

magazine/newsletter to attempt to generate satellite

interest in the countries where there is coverage but no operation...".

A lot of more interesting things to do instead of to waste time for letters...

Best regards

Gennadi

From: Dominic Baines
Topic: 1100 Message: 1100

As a relative/complete newbie to satellites I need some info as to where to start as other than sitting on the appropriate up/down links, pointing a yagi vaguely south when satellites are passing and listening not heard anything yet.... anyone interested in helping?

I tend to operate HF but I am also one of those that operate stations for 24-72 hours when away on work especially if it is an island so I would guess I might be of interest to those looking for rare/semi-rare grid square activations.

Thomas,
Very well done indeed, I applaud you.

This is how we should make the potential newcomer welcome.

You are a credit to EU-Amsat.

1103. Re: Satellite DX

Yahoo group: eu-amsat
Date: 2007-12-02 01:57:29 UTC
From: mika.siira
Topic: 1094 Message: 1103

Hello folks,

Greetings from northern Finland. I agree all about what Gennadi wrote, the situation is about the same here.
I got my first "bite" on amateur satellites on august 2005. I purchased a VHF/UHF multimode rig that I used for contesting and after contests I tried to figure out more use for the rig. Satellites were one option for me and I have never regret that choice.
During the summer of this year Jussi, OH5LK wrote an article in our national ham radio magazine about operation on ham satellites. Just for curiosity I asked few months ago on at one national irc channel for "people interested in radio" who have been working on satellites after this article. I got two answers. The first was "I dont't like to work via repeaters" and the second was " I have worked the satellites already in 1980's"(this comment was from the famous OH HF contest operator).In my opinion, this discribes clearly the attitude what "ordinary hams" feel about operation via satellites.

For "newcomers", I strongly suggest to start satellite operations on passband satellites. FM sats are published as "easy sats", but are they really, let's say with 5W tx power and arrow type antenna in Europe? Listen yourself few passes on AO-51 over Europe and figure it out...
In OH-land I know there are many stations that are well equipped with antennas and radios (VHF/UHF), but those stations have never been heard on satellites. I suppose they are well aware what they could work with their setup, but it is just the question of the lack of interest. And the question is how we could awake the interest of those stations?
During the past two years I have worked some 50 DXCC countries over LEO sats, and remaining 50 lands for DXCC award will take some 10-20 years withing the current speed :)
Just my few cents at early morning hours...

Mika, OH8MBN

1104. Satellite DX - why bother?.

Yahoo group: eu-amsat
Date: 2007-12-02 08:23:28 UTC
From: John Hackett
Topic: 1094 Message: 1104

In reply to Mika and Gennardi,

Having operated radio for over 40 years I am well aware of the negative attitude (for various reasons) of certain stations (mainly HF orientated) regarding satellites.

Please read my original mail again ... so! many people wonder where the challenge is ... *THERE* !!!! is the challenge ... getting some activity from those places that are DX ... and remember!, what is "DX" on HF is not necessarily DX on satellites.

DX (in this context) is an acronym for "distance". Though your signal may traverse the ionosphere twice when operating a satellite, please remember, it's the transponder that is doing 50% of the work.

Are more "accurate" measurement via satellite is Km per watt, but it's the efficiency of the aerial system that is the main parameter.
The state of the ionoshere at any given location (different at different locations) also plays a major part.

Of course! the experienced operator knows this but please remember, there are continuinely potential newcomers "popping in" for a look to see what this reflector is all about so let's try to be positive folks. It doesn't cost anything.

73 John.

1105. Satellite portable.

Yahoo group: eu-amsat
Date: 2007-12-02 13:51:56 UTC
From: John Hackett
Topic: 1105 Message: 1105

Satellite portable ... or ... satellite tracking on your mobile phone.

Avid readers of the bulletin boards may be aware that a couple of years ago I mentioned that it might be a good idea if someone wrote a tracking program for mobile phones that ran the popular Symbian operating system.

At that time, nobody resonded.

There have been programs for certain PDA's and Win-doze mobile but until recently, nothing for the Symbian OS..

A portable satellite station can be as small as a dual-band handheld, a 3/4 wave whip (albiet minimalistic) and your mobile phone.

Of course, one can print out orbit predictions as well as lugging around a laptop for fancy graphics - but the really 'smart' people could just
use a 'smartphone'.

Therefore ... since nobody responded first time around - (I can't even write my name properly) - I repeated my request for someone to write a tracking program for Symbian phones ... which resulted in K0SM Andy making me aware of his excellent tracking program for mobile phones called 'SATme'.

Users of Java programs on mobile phones are usually aware that many strange things can and usually do happen with the installation of certain programs.

The reason I mention this is to illustrate the 'service' Andy provided - which was nothing less than spectacular! ... in fact, he customised his program - (on a Saturday night !, while we were in "QSO" on the internet) - to specifically fit my N70 phone, giving me the parameters I wanted in a tracking program for portable operations.

Tailor-made tracking programs? ...this is most certainly in the true spirit of amateur radio.

A DEMO of Andy's program may be downloaded from this location ... <http://www.k0sm.com/>

I'm also using my phone as a QSO recorder ... as well as transmitting CW WAV files ... to compliment the maniature homebrew keyer I have strapped to my thigh, made from 2 x microswitches 'thieved' from a computer mouse. I have the phones clock set up for various satellite 'periods' - (AOS audio warnings, to you!) while the phone's 'notepad' shows the uplink/downlink frequencies.

A mobile phone can be a very useful addition to your portable satellite station if you don't want to lug your laptop around.

The 'Mprs' program not only shows up on Findu.com - it sends your GPS position and if you wish, even a text message from your phone.

Google maps is self explaitory.

Did I mention that in extreme cicumstances my Nokia N74 could even be used as a telephone ??.

1109. AO-7 ... N1DID & K9CIS note.

Yahoo group: eu-amsat
Date: 2007-12-04 08:17:43 UTC
From: John Hackett
Topic: 1109 Message: 1109

Hi All,
It's December again ... (ho -ho-ho) ... and consequently my administrative privilages for The AO-7 Resource Page log have expired.

(This means I can no longer edit the mistakes)

Emily N1DID hasn't responded to my mails so the log will probably very soon get out of hand again.

Frank (K9CIS) on orbit 51248 at 23:27 you've logged K3SZH twice for the same QSO.

Each station can still edit their own entry (but nobody else's) by clicking on the hourglass at the left of your entry. A new screen will pop up and you can just correct any mistakes.

PLEASE !!! be careful to enter the correct data because if you don't notice your error it will soon throw the log statistics out of whack and defeat the entire object of the log ... which is an ACTIVITY log *NOT* a contest log.

I have administered the log for three years but am now concentrating on a different long term activity regarding AO-7 which, hopefully, will benefit the entire amateur satellite community - commencing in the spring of 2008.

A request to the ANS editor regarding careful entries in the log and how to edit it would be very much appreciated.

73 John. <la2qaa@...>

Yahoo group: eu-amsat
Date: 2007-12-04 17:57:43 UTC
From: John Hackett
Topic: 1110 Message: 1110

Hey Bob,
That's a great !!! idea ... I wish !!!! I knew how to do it.

Emily, who wrote the program "disappeared" into the "Second Life" virtual world over a year ago and has not been heard of since!.

She used to send me a cookie every December to reactivate the annual editing privilages I had from my computer.

I have a copy of the cookie but have no idea ! where it should go to activate the program again. Last December I just messed around with it and somehow managed to get it into the right place by a fluke! ... sheer luck ... this December, after messing about all day I can't find out where it should go.

Needless to say, I am most definately *NOT* an IT guru.

I'll bat this mail to both reflectors Bob just in case somebody recognises the problem and can advise me how to correct it.

I think this web site is invalueable I use it all the time. The only change I would recomend is, if there is a comment for a particular contact it would help it the little eye glass would change color or somthing to indicate that there is infact a message there. Yes I totally agree it is not a contest log but to be honest it is fun to see who is where.

Hello Thomas,
Thank you for your kind words.

No, I have no intention of attempting to contact Emily in her "virtual" world - many Amsat folks have tried - without replies.

Yes, I've known about her whereabouts for a couple of years now but if she doesn't want contact with the real world that's her perogative and I respect that.

Personally, I have enough problems to deal with in "this" life without seeking tranquility in a "pretend" world, Thomas.

Rick Hambly (Amsat president) mailed me and has offered to (try) to help with the log page issue so all may not be lost. Quite a few of the NA members have realised what a resource the AO-7 page is.

I wish we had such a page for every satellite "afloat" and it would be a 'TREMENDOUS' advantage to have a similar page for P3E.

You whom speak German Thomas, you might like to pass that suggestion along to the team with your and my regards.

There is such a page for almost all satellites: http://oscar.dcarr.org/

With my bad Englisch I will try to be a mediator between AMSAT-DL and
"AMSAT-EU" in this group.

Let first be P3E in orbit, then we can look forward for such a logpage.

1114. AO-7 log *NOT* correct.

Yahoo group: eu-amsat
Date: 2007-12-06 10:43:17 UTC
From: John Hackett
Topic: 1114 Message: 1114

Please be aware that the N1DID AO-7 log will now no longer show the correct results.

An example ...

4th December orbit 51254 JH3XCU/1 claimed 32 points ... from 915 contacts (no QSO's) to 947 contacts (no QSO's) for a single pass.

One station logged a QSO, claimed the points but logged the transponder as being OFF ... (which it couldn't have been if he made a QSO through it).

Such entries make a mockery of the object of the log.

Also - LA2QAA no longer edits the entries.

Hi all,

Thanks everyone for the emails and advise about places to look for information..

After reading up a bit more I think the real problem I have is antenna and polarization.... so I will start to try something easier first and try the LEO FM AO-satellites with 2m up and 70cm downlink. I am going to try and build a combined 2m/70cm 3el/7el yagi. I have a SOTA 3el 2m yagi to use as a template.

Rig will be ft817 and I will also be making a duplex and maybe a preamp for 70cm.

Regards,

Dom

I am also advised to try some of the other satellites with CW beacons e.g. LUSAT-OSCAR-19 (LO-19) on 437.1252 +- doppler in USB, it has a very strong CW-beacon. Listen in USB, not in CW. If anyone else has a list of beacon/CW possibles (from UK) then I'd be interested.

LO-19 is a simple sat to receive (assuming it's still working in CW beacon mode). You'll have no problem with the FT-817 and a 5/8 vertical. It'll be audible...

From: SV1BSX
Topic: 1100 Message: 1118

Hi Dom & Group,

yes, antenna is very significant for satellites.
However, don't involved with Circular Polarization and Pre-amps.

You can do it great with Linear-polarization, especially now - in your
"first steps".

I believe that the Circular Polarization is too much "comlpicated"
for a newbie without any sifnificant advantage for LEOs Sat, because
the value of circular polarization for LEO satellites is somewhat over
rated.

Circular polarization can provide a 3 db advantage over linear
polarization but that is only true if both transmit and receive antenna
have the same polarization and both are aimed directly at each other.

Although this works extremely well on the HEO "stabilized" Sats, that
almost never
happens on the LEO satellites. On LEOs you need to change the
polarization between RHCP & LHCP for maximum receiving signal.

A smart combination is to mount one antenna at 45 degrees. Thus you
have -3 dB from all polarizations (RHCP, LHCP, Vertical & Horizontal)
but even if weaker the RX signal, is stable enough
(in order to avoid "complicated" antenna systems).

73, Mak SV1BSX

ps: A nice Homebrew ARROW with 4 VHF / 8 UHL El, you can find here:

http://xe1mex.gq.nu/antenas/yagi.html

It is tested and doing excellent job on LEOs.

Apologies confusion....

The antenna I had in mind was, on the same boom a 3el 2m and a 7el 70cm with the two at 90 degrees to each other.

I have usedcircular polarization with 2.4HGz with some success although contruction is 'fiddly'.

On the LEO pass I adjust the polarisation of the yagi to match best signal reception. I also read that a simple pre-amp on RX improves matters.

1120. AO-7 DX.

Yahoo group: eu-amsat
Date: 2007-12-08 11:09:38 UTC
From: John Hackett
Topic: 1120 Message: 1120

Hello Al,
Fantastic DX om AO-7 this morning ... LA6KJ no less ...
thereby dispelling the myth that 'Norwegians' don't know what satellites are.

The real reason of course is that Norway is too far north for the current crop of satellites like the ISS and AO-27 so the interest has always be low.

I seriously doubt if there are many NOG's who have heard of AO-51 and VO-52 ... when I mentioned them at the local radio club I just got blank looks ... half of them asked which tubes and sockets these satellites used - the other half claimed that amateur satellites are a complete myth! - instigated by the CIA - like the moon landing (!).

How many Nog stations have you !! worked via satellite ?.

(... and before anyone accuses me of hippocracy, I do try to get them interested and even managed to succeed once - in 1990 - I had a local station in Kristiansund receive himself via RS 11) ... however, 10 wild horses or upon pain of death wouldn't persuade him to speak into the microphone.

John,

I worked 15 LA's on sat. I think that's even more than the PA's I worked on sat.
So I guess there are more LA's active than you think.

Hello John,
great information regarding "Fantastic DX"!

I worked with 13 different LA station via satellites.
Sure, they are rare enough, but I did not mention, LA are DX.

1. LA2QAA 6 times. FO-20, FO-29, AO-7, VO-52.
2. LA7SP 1 time. AO-10
3. LA5QIA. 1 time, FO-29
4. LA1WH 2 times. UO-14, AO-51.
5. LA9GHA 1 time, UO-14
6. LA1K 3 times, UO-14, FO-29
7. LA0FX 1 time, FO-29
8. LA6KJ 2 times, AO-51, SO-50.
9. LC5QBT 1 time, UO-14
10.LC3WAT 1 time, UO-14
11.LB9ME 3 times, AO-7, VO-52, AO-51
12.LC4IBT 1 time, AO-10
13.LC1UCT 1 time, UO-14

I never (or VERY seldom!) working with the same station more, than 1 time
via the same satellite.
I believe I heard same stations many times, but did not call themes.
So, LA-stations not are so DXes, as the Baltic stations (LY, YL, ES). Hi-Hi!!
To All, mentioned above, the QSL-cards were sent via the buro.
Whom I've got back?
Only LA1K, LC3UCT, LC3WAT, LB9ME and LA7SP...

Hello Mak

Your country is a DX-country, my country is a DX-country, every country
is a DX-country. This was the first thing I learned about making QSOs
via satellite in the beginning of my satellite operators, AO-10, days.
Ergo: ALL QSOs via satellite are DX-QSOs !

1128. JA bandplan and stations on AO-7

Yahoo group: eu-amsat
Date: 2007-12-08 20:03:36 UTC
From: mika.siira
Topic: 1128 Message: 1128

Hello folks,

Today at my AOS of orbit #51306 I heard JA0BBW calling CQ (I spotted this to DX cluster as RW3XL also did). I have worked this station and another JA station earlier this year on AO-7 (mode B), and as I have been told, this segment of the UHF band of the AO-7 uplink is not allowed in Japan for satellite communication.
Most of the JA-stations on AO-7 seems to make contacts on mode A, but as you see from the log there is also some QSO's on mode B. Is this because those few stations don't know their national rules or because they just don't want to follow those rules?

Another question regarding to the issue above is that is the situation the same in HL/BY/VR-lands too? I have never heard stations or seen log entries from these lands on AO-7.

Yours,

Mika, OH8MBN

As you all know, the worldwide range for satellite ops on 70cm goes from
435 to 438 MHz. But AO-7 was built before this IARU-regulation was made.
Today, officially the Mode-B uplink on 432 MHz is not allowed in all 3
IARU-regions. But, I can only speak for region 1, you are allowed to morse
on 432 MHz. If your morse transmission can be heard via the AO-7
B-transponder,
well..., why not ? I don't know, if it is accepted, if you speak on the
wrong sideband in the DX phone part.

I also don't know what "Wide Phone Morse Image" means in Japanese bandplan.
This is probably why the Japanese OMs don't works on Mode-B.

Hello Thomas & group,

I am aware about Japanese bandplan. Actually I asked this AO-7 issue
from JARL direct and I got the answer that japanese hams are not
allowed to use the UHF segment of AO-7 uplink for sat communication,

but I did't get the reason for that (I asked that also...).
According to the japanese bandplan, if "phone,morse" are allowed at that segment, should the AO-7 QSO's be also allowed? When you transmit your signal, it will not "choose just the terrestial way"...
I know there are much more hams using VHF/UHF frequencies in Japan than in Europe (and especially in Scandinavia) and if the operation on AO-7 as "just transmitting" on UHF disturbes terrestial contacts is the reason, then I uderstand the restriction completely.

Mika, OH8MBN

Hi Mika & Group,

I was looking for JA-Bandplan and I found a DOC from JARL.

I can't find something unusual on UHF Bandplan of JA-land. 435-438 is for
Satellite service and
the vexed "subzone" (+- 432.150 MHz) it's exactly like my country (and the
most European
countries, I believe) : Phone, CW, Image.

I think the JAp's friends are OK into the game of Mode-B, without any
foul-play.

Just my 2 cents worth....

73, Mak SV1BSX

From: John Hackett
Topic: 1123 Message: 1133

Hi Mak,
Now there's !!! an interesting one ... "I'll put my antennas in the highest position".

Being an old (old & senile) signaller I can of course use semaphore (flags) to transmit messages as well as CW but your idea of signalling something with aerials at 90 degrees is excellent!. I'll remember that.

Nit-picking department.

Insects have "antennas" ... (antennae actually) ... those elements we use to transmit and receive radio waves are called aerials.
The Americans christened them antennas - but of course "they" can't speak ENGLISH anyway!.
... he he he.

Relax! Mak, it's 'tongue-in-cheek' (joking) . I'm just being obnoxious (holier-than-thou).
A bit of fun nothing more.

Seriously, in actual fact, these insect antennae do actually receive "information" so they could also correctly be called "aerials".

An interesting frequency-to-length formula though ... I've never seen an ant with a parabol.

Subject: [Meteor-Scatter] First(?) 144-MHz-QSO via Reflexion on ISS

===8<==========Original message text==========
Hello All,

Triggered by Peter SM2CEW's tries to complete a QSO by using the ISS as a
reflector Frank DH7FB and I decided to try that as well. From Peter's
experience (and also Frank's when SWLing Peter's tries) we believed it would
be worthwile considering BPSK63 as this would enable us to exchange all
information within few seconds only (using the EME report and QSO rules).

However with the first tries on 8 December we quickly had to realise the
amazingly quickly changing large doppler makes use of this mode impossible
and we returned back to good old CW since this is also copyable at such a
situation when you are not 100% tuned on the signal. The second try today
Sunday 9 December at ISS orbit 51845 starting with a common window at 1626Z
we copied signals at elevations of > 20 degrees and within a minute
exchanged all data. Signal reports were about S3...S5 (DF2ZC running only
300 watts out). It was a tough task to follow the quick doppler changes and
also adjust elevation and azimuth rotators. Two hands is at least one too
few...

That was a thrill! And now we are celebrating...

And we will try more QSOs the coming days.

btw http://www.n2yo.com/ gives a nice live google earth graphics display of
ISS and other satellites.

From: SV1BSX
Topic: 1137 Message: 1137

Hi Gennadi & Group,

very interesting indeed!

However, I can't see details about antennas (oups! sorry John, AERIALS!).
Just the used power (300 W), but what 300? Output Power or ERP?

Gennadi, do you know something about the aerials which have used on this
experiment?

If we talking for EME-type aerials, probably is something very difficult
for the majority of amateurs which work with the satellites.

About your comment "the most modern way to use the satellites" (he he !)
don't forget the ISS it's like a ...football playground, so the reflection
surface
of it is big enough !

Thanks for FWD.

1139. Different propagation modes.

Yahoo group: eu-amsat
Date: 2007-12-11 15:41:47 UTC
From: John Hackett
Topic: 1139 Message: 1139

Mak and Group,
It's *NOT* necessary with an EME array or 'Radio Moscow' power to work interesting propagation modes at VHF and UHF.

LA4XGA lives on the Island here and we're about 1.5 kilometers from Kristiansund airport, Geir uses the aeroplanes taking off and landing as passive reflectors for "MS" meteor scatter" type QSO's and has had many contacts with German stations using this mode. He uses 200 watts to a homebrew 17 element yagi on 2M.

Here on the Island we have a *LOT* of Aurora (Northern Lights) to use as a passive reflector. A lot of the QSO's I used to have on this mode was 5 watts to a pair of 6 el: 2m yagis.

Personally, I use the mountains as passive reflectors. Every Stateside LEO satellite QSO I've had from my present QTH in the last 5 years has been by knife-edge propagation on 70cm. This is because there is a *LARGE* mountain right in front of my nose ... blocking my view towards North and South America.

My only clear piece of sky is towards the north Pole but judging by the QSO count in the AO-7 log I seem to do OK, particularly since I usually only operate 1 pass per day.

I also used 'Freikollen' (a local mountain) as a passive reflector with a QSO with Aldert PH7PCF on AO-7 with an ERP of 25 watts.
(my maximum power output)

IT IS NOT NECESSARY WITH A LOT OF POWER ON SATELLITES.

It is vain to do with more that which can be done with less

William Of Occam.

Topic: 1139 Message: 1140

Hi John and the GROUP,

Sure, it is NO necessary A LOT OF POWER, when you using satellite, like a
active
transponder (or FM repeater).
But SM2CEW used in his experiments the ISS, like a PASSIVE reflector.
Which is far away from him.
I think, all of us did used a mounting and buldings, as a reflector.
I know, that SM2CEW has a 6 x 18 ele. yagi and DH7FB has 4 x 12 ele yagi.

Some kinds of propogation NEEDS a very good ERP, because
"Life is too short for QRP"-(Not my words!)...He-he!

But some times can happend fantastic things.
01.06.2006 was E-sporadic opening in 144 MHz.
I worked with YU1MS (QRB 1269 km). He used ONLY 1.5 watt output
and indoor loop antenna!!! This article in a "Radio Amateur" magazin.

My personal "achievements" are 100 mW into rubber antenna wia UO-14
25W output into 4x9 ele. yagi (many QSOs via AURORA) and 25W output into
4x18 ele. yagi in Meteor scatter with DL8II.
But this all was just for fun...

Mr Hambly is probably the one who will killed AMSAT-NA as he is the lead
politician...

He does not support any opinions who differs from his, He censored any
commenting who makes 's AMSAT-NA looking bad even if it is the plain truth,
He's playing with the AMSAT membership money at will. To finally never obey by
this faked membership survey where members express their needs regarding
amateur satellite.

AMSAT-NA is a joke run by a bunch of jokers who are driving AMSAT-NA affairs
only focused on "target of opportunity"?

I am not surprised that he don't put his letter on AMSAT-BB!!! fearing the
membership reaction as usual he play in the back of the AMSAT-NA MEMBERS AND
THE INTERNATIONAL AMATEUR COMMUNITY AGAINST THEIR WILL.

Poor AMSAT-NA members who generally merits much more than this...

Drive your money where a real AMSAT group remains focused on their target P3E
and let them go by their Mars P5 project even if they still feel it is a
reachable target or not after P3E launch and completed mission.

Hello Gene and group,
Nah!, life isn't too short for QRP Gene ... yes, I know !!! you didn't mean it literally ... I'm just 'boasting' here - he he
The attached pic illustrates what can be done with QRP ... daily !!!, (not 'one-off') QSO's.

Mind you, I do admit to using an aerial (sorry Mak, ANTENNA) as opposed to a piece of wet string or a rusty 6 inch nail ... well if that American needed an 80 watt BRICK for AO-7 he *MUST* have been using a wet shoelace for an aerial.

Dear all,

very, very interesting topic! I have done quite some airplane scatter on 2 m myself (100 w to 9 el) and I wonder how low can you really go in terms of ERP to effectively bounce signals off the ISS. Next spring, with my new array up, I'll run some tests.

Only partially related to this are the very positive experiences I've had in recent weeks with VO52 and AO7 with a big wheel for the uplink and an HF beam for the 2m downlink. The beam is a miniquad, which happens to resonate (or at least show low swr...) on 2 m as well. Signals from HAMSAT can be as strong as s5 (with 35 meters of RG213...). This - again - shows how the birds are within reach of ANY station!

1144. FW: Correcting the AO-7 log

Yahoo group: eu-amsat
Date: 2007-12-12 18:58:15 UTC
From: John Hackett
Topic: 1144 Message: 1144

From: la2qaa@...
To: archie.hackett@...
Subject: Correcting the AO-7 log
Date: Wed, 12 Dec 2007 19:53:16 +0100

Hello Joe,

Apparently, Emily appears to have abandoned the "real" world and
chooses to stay in the "virtual" world in SECOND LIFE.

(Her perogative!).

Consequently,
She doesn't answer her mail so I didn't get the key I requested - which
is a pity because the AO-7 log is already in quite a state of disarray
- (which I warned about).

You'd think Emily would be interested
in keeping the log "tidy" because a lot of people have mentioned what a
useful resource it is.

However Joe, all is not completely lost ... each station can edit their OWN !!! entries ...
(but no-one else's).

I
put a message on both reflectors about this but as you can see from the
log, several people just ignored it completely. It rather amazing that
the next time they log on they don't see and correct their own mistakes
- whether it's laziness or just being half asleep is anybody's guess.

To
edit your own entry - just click on the hourglass at the left and a new
window pops up ... edit it then delete the original "wrong" entry.

You can delete YOUR OWN entries - but nobody else's.

I *WISH* Emily would reply so that I can start cleaning up the errors.

Too
many accumulative errors will soon have the data being "off" by a mile
... it's in everybody's interest to be dilligent when entering data in
the log - and correcting any mistakes made ... they are after all quite
obvious !!! with blank lines etc.

I just can't be bothered to
e-mail all those that make mistakes and don't bother to correct them. I
used to but I've given stopped handing out daipers.

I agree absolutely with your FM comments - you know my thoughts on that subject Joe.

I batted this to both reflectorsd on the offchance that those who have made mistakes might correct their own entries.

(Aye! ... and pigs might fly.....LA2QAA)

Have a nice day Joe mate.

From: SV1BSX
Topic: 1146 Message: 1146

John & Group

several operators they have reported that, the AO-7 LOG does not accept always corrections.

So, in order to be able to correct a previous entry, it's necessary to "check-in" the "REMEMBER ME" check-point .

This must be done by pressing the "NEW CONTACT" button, where a new page appears the field with CALLSIGN, LOCATOR etc.

Here is the "REMEMBER ME" check-point (right-down corner of page).

So, please write carefully your Callsign, your LOCator etc. and then "check" the REMEMBER ME.

Add also your new contacts and push "SUBMIT" (and "CONFIRM" after the SUBMIT).

After this procedure, the LOG-page and your PC is in co-operation through the

"Cookies".

Do not try to correct (edit) your previous records at this time.

Reboot your PC and try to connect again with AO-7 Log. If now are all OK, by

pressing the "NEW CONTACT" button, your CALLSIGN (& your LOCator) it

should be already appeared on the field.

That means the LOG remembered you, so you are OK 100%.

ONLY NOW you can edit your previous entries by using the "Magnify-Glass" on the main

page. (AO-7 logbook).

Keep in mind also, in order to be able to work properly the "LOG-Correction", the "Cookies" should be always accepted from your PC.

That is absolutely necessary!

Also any program which prevents the "Pop-Up" windows (like Ad-Aware etc) must be disabled (the "Correction-field" uses "Pop-Up" window).

Hope this helps.

Subject: Correcting the AO-7 log
Date: Wed, 12 Dec 2007 19:53:16 +0100

Hello Joe,
Apparently, Emily appears to have abandoned the "real" world and chooses to stay in the "virtual" world in SECOND LIFE.

(Her perogative!).

Consequently, She doesn't answer her mail so I didn't get the key I requested - which is a pity because the AO-7 log is already in quite a state of disarray - (which I warned about).

You'd think Emily would be interested in keeping the log "tidy" because a lot of people have mentioned what a useful resource it is.

However Joe, all is not completely lost ... each station can edit their OWN !!! entries ... (but no-one else's).

I put a message on both reflectors about this but as you can see from the log, several people just ignored it completely. It rather amazing that the next time they log on they don't see and correct their own mistakes - whether it's laziness or just being half asleep is anybody's guess.

To edit your own entry - just click on the hourglass at the left and a new window pops up ... edit it then delete the original "wrong" entry.

You can delete YOUR OWN entries - but nobody else's.

I *WISH* Emily would reply so that I can start cleaning up the errors.

Too many accumulative errors will soon have the data being "off" by a mile ... it's in everybody's interest to be dilligent when entering data in the log - and correcting any mistakes made ... they are after all quite obvious !!! with blank lines etc.

I just can't be bothered to e-mail all those that make mistakes and don't bother to correct them. I used to but I've given stopped handing out daipers.

I agree absolutely with your FM comments - you know my thoughts on that subject Joe.

I batted this to both reflectorsd on the offchance that those who have made mistakes might correct their own entries.

(Aye! ... and pigs might fly.....LA2QAA)

Have a nice day Joe mate.

Hello group,

2000 QSO just via AO-7, this "old bird"....
Hm-m...
How to find so many "uers" of AO-7?
May be he worked via AO-7 during all those 30+ years, even, when
bird was "dead"?
Who has more via AO-7?
May be it was his QSO "number 2000 via satellites" in his logbook?

Strange, that I meet Igor firstly on satellites only in 2005 (VO-52)
and never before...
In my lodbook only 3843 QSO via satellites (RS, AO-7, AO-10 e.t.c...)
Very poor result...

Gene,
Here's an explanation.

Some days UA9CS Igor works as many as 7 stations on a pass.
Each of these stations enters his callsign -
5 or more passes a day gives a *LOT* of points.

Now maybe people can understand what I was rambling on about these last months re: "points" in the log.

A few months ago, Igor was well behind me, now he's well ahead.
It all depends on how active a person is. Note that the actual figures I quote above are THEORETICAL. Igor doesn't always work 7 stations per pass.

There were *VERY* few stations who worked AO-7 in the 70's. Mostly Americans.

The JH station in 7th place has ammassed several hundred points without one single QSO ... which of course makes a complete mockery of the points system.

As I have mentioned on both reflectors several times. The log is an ACTIVITY log ... *NOT* a contest log. The "points" system is an ill-advised design in my opinion - others may disagree.

Accumulative errors from sloppy entries will eventually make the log show incorrect results.

John,

thanks for explanation!
BUT, read carefully one more time:

UA9CS CONGRATULATIONS IN YOUR 2000 QSO'S ON THE OLD BIRD.
WELL DONE IGOR MY FRIEND.
73 TERRY G1WPR.
Where here is the word "POINTS"??
Number of "points" not the same as number of "QSO"!!
Every word has his own significance and in this case "significance" was lost.
That's why I was really surprised!

Am I wrong?

1150. AO-7 Log - point taken ... (pardon the pun).

Yahoo group: eu-amsat
Date: 2007-12-13 13:03:59 UTC
From: John Hackett
Topic: 1145 Message: 1150

Yes, point taken Gene,
But nobody (including K3SZH) has the same number of QSO's as points on the log.

The log gives points for the number of times a callsign is mentioned.

Terry's inadvertant use of the word QSO instead of "points" is a small reminder of the rather odd way the log actually "counts".

It's neither Igor's nor Terry's fault K1DID arranged the coding this way.

I've brought this to the attention of the users several times but am usually reminded that ... "Relax!, it's just a hobby!".

Gene i ment qso's not points. To get a point = 1qso. Its not a race to see who is the best. We all like our hoby and should treat it so. I emailed John LA2QAA today to give my opinion. Howe many times we have worked a station who does not use the logging system (many) so no qso-point for that one.
As from today i will not use the AO-7 log, i will still use the sat, as i have made many friend through this old bird.
Enjoy the hoby, look foreward to say HI to you on the sat.
MERRYCHRISTMAS TO ALL MY SAT FRIENDS. HAPPY HEALTHY 2008.
TERRY G1WPR.

The AMSAT-NA censorship service seems to work only on me!!!

Here is our famous and proud fellow American "The ugly one" as i am forced to say most of them just are fine peoples.

I don.t know why AMSAT BOD seems to attract all the poor souls of the American satellite community?(Women included)

I for the hundred time will repeat there is no salvation in the amateur satellite radio community if each and every AMSAT'S STICK TO THEIR OWN SMALL SELFISH AMATEUR SATELLITE PROJECT.

It is only in forming one international real AMSAT where all the funding will be directed that will emerge any future viable project. Thank's to AMSAT-DL who stick to their goals instead of running like mad cows at each new girls who turn the corner!!!

As usual the AMSAT-NA janitors are coming back with their insults and named calling (By the way it seems that's the way to go in NASA engineering meeting!!) I was in Cocoa Beach (FL) last week for the shuttle launch and i got plenty of time to listen to some NASA and ESA folk's while taking my breakfast at the The Omelet Station and it is hard to believe how most of the new era space engineers are well mannered and polite probably AMSAT-NA just get the left over and it is confirmed when i read all Mr Hambly babbling through his hat.

He does not even see that all his funding attempt are vain the thermometer and the elitist president club is there to fund only their annual social bonavista club meetings and drinking... and the Eagle fund will be redirected to their "NEW" target of opportunity their "emergency selective satellite availability system" ESSAS!!!

Mr Hambly can i humbly ask you what happen with your government charitable AMSAT-NA listing REGISTRATION? how much money are you getting from this venture?

I'll tell you you will see coming soon a new AMSAT-NA cube or goodies to patch the hole as ECHO was "FILLING THE VOID"

P.S. If you want want to see NASA folks live just pass by Durango restaurant in Cocoa Beach and at the cheaters club just near by...;) some executive are even coming in their black official limo nice idea as they are better to not drive their own car:)) As with AMSAT-NA socializing seems to be the way to go there also. As tax payer money and membership money it is is made to circulate..

Got nice picture from the space coast BTW...

My 2 euro's I have suggestions to be disclose only on AMSAT-BB!

Merry Christmas and stay safe on the roads. Alcohol and gas are fuel for rocket engine only...or it is gas lighter!

Hello Group,
I know what Mak means when he talks about being 'lonely' on early morning AO-7 passes. This Sunday morning at 04:58 I had a range circle that was well over 7000 Km stretching from Frei Island (Norway) to Dhaka - (that's the capital of Bangladesh for those who got a C in Geography).

Of course, it wasn't 4 AM for everybody ... and for those that it was, they'd probably say ... Sunday morning ?? ... GET A LIFE !!!.

Feature December 17, 2007

NASA Climate Change 'Peacemakers' Aided Nobel Effort

It's not every day that a NASA scientist can wake up and think, "Hey, I did something for world peace." But on Monday, Dec. 10, many NASA Earth scientists did exactly that.

In Oslo, Norway, the King of Sweden presented the shared 2007 Nobel Peace Prize to former U.S. Vice President Al Gore and to representatives of a United Nations panel that has spent two decades assessing Earth's changing climate and predicting where it is headed. Hundreds of NASA scientists, including some from JPL, contributed to the United Nations effort, working with thousands of their colleagues from more than 150 countries.

Announcing the Nobel Peace Prize, the Norwegian Nobel Committee said the scientific reports issued since 1990 by the United Nations Intergovernmental Panel on Climate Change (IPCC) have "created an ever-broader informed consensus about the connection between human activities and global warming." The peacemaking value of this scientific finding, according to the committee, is that human-induced changes in climate may cause "large-scale migration and lead to greater competition for the Earth's resources" and an "increased danger of violent conflicts and wars."

The Fourth IPCC Assessment, released this year in four reports, presented the strongest findings thus far that human activities are altering Earth´s climate and that the impacts of climate change are occurring already.

When the First IPCC Assessment was reported in 1990, NASA was building on a history of Earth remote sensing, developing and preparing to deploy the Earth Observing Satellite system to determine the extent, causes and regional consequences of global climate change. In the recent Fourth Assessment, scientists were informed by more than eight years of

systematic,
global observations of the Earth system. Satellite measurements have revealed fundamental
changes in Earth´s climate, including temperatures and rainfall, ice extent and properties, and sea
levels, as well as physical, chemical, and ecological impacts of climate change. NASA satellite
measurements contributed immeasurably to enable the IPCC´s strongest conclusions thus far.

"NASA is best known for its cutting-edge satellite instruments and global measurements of Earth
from space, but we contribute a lot more than that to climate change science," said Michael
Gunson, acting chief scientist in JPL's Earth Science and Technology Directorate, Pasadena,
Calif. "NASA´s role extends far beyond space-based measurements into the research to build our
understanding of climate change, enabling the critical work of the IPCC."

NASA instruments, data, analysis and modeling all contributed to the bedrock of the IPCC
report: the hundreds of papers published each year in scientific journals, many authored by
NASA scientists and many others using NASA observations. The authors of the report draw on
this ever-growing body of new knowledge to form their conclusions about climate change.

"The most remarkable thing about the process of assembling an IPCC report is that you can
actually get thousands of independent-minded and critical scientists to work together without
killing each other," said Bruce Wielicki, senior scientist for Earth science at NASA´s Langley
Research Center in Hampton, Va.

Wielicki contributed a portion of a chapter in the latest science assessment on how Earth´s
"energy budget," the ebb and flow of radiant energy from the sun and our planet, has changed as
measured by satellites. He began the project in October 2004 and, working with a team of 10
scientists, completed a compact summary of the latest research on the topic 20 months later. Like
each section of the IPCC reports, Wielicki's section went through repeated rounds of critiques by
other scientists.

NASA's Cynthia Rosenzweig, a plant and soil scientist at the Goddard Institute for Space

Studies, New York, N.Y., coordinated a key chapter in the new report on the impact of climate change -- an effort that took four years. "There were many, many late nights as we worked under strict deadlines to draft the chapter and revise it based on thousands of comments from reviewers, each of which had to be documented and responded to," Rosenzweig recalls.

"But the toughest part of the entire effort was the last step: reviewing our final draft with government officials," Rosenzweig says. Before each IPCC report is published, the lead authors sit down with diplomats, lawyers and environmental officials from around the world to review their findings, page by page. "These week-long meetings are very challenging as you respond to all sorts of concerns and questions. But this process is the real beauty of the IPCC. The final documents that emerge represent a consensus view of the world´s scientific community and government delegates."

The Nobel-winning IPCC reports have no parallel as the most authoritative source of climate science, says Wielicki. "When I give public lectures on climate, I tell my audience that there are three laws of solid information on climate change: IPCC, IPCC and IPCC."

The IPCC effort has also boosted public awareness of this critical area of science. "By collecting together the current scientific thinking on climate change, the IPCC showed the world the value of the type of science we are doing at NASA," said JPL's Gunson. "And that has really engaged the public, many of whom were surprised that NASA does climate research. It has really motivated a new interest in the work we do here day in and day out."

Emergency Preparednes and communications to me has always been a prime motivator in Ham radio.
>

Lest say it is a noble goal but it is one within many others means in an emergency situation.

More than anything else the main asset amateur radio has is related to the vast work force.

Numerous ham who can be emergency operators BUT with the average ham age now near the seventies the only one assets who remain is the fast equipment turn over rate eg:"quick installation" but who will be able to sustain a long period of operation?

The technology is there but most of the operators will probably not been able to make it...!

It is a noble cause to make PC'S available to world third countries but feeding them is also noble remain to be evaluated... the priorities?

P.S It's sad this brilliant idea remain confined in the North American continent! Sorry folks in the rest of the world better luck next time and don't call us will call you...

1161. AO-7/A : Great conditions today

Yahoo group: eu-amsat
Date: 2007-12-21 15:24:07 UTC
From: SV1BSX
Topic: 1161 Message: 1161

Hello all

today morning I surprised because I had access to AO-7 at 1-2 degrees Elevation (North bearing) during the morning desceding orbit of "Old Girl", just after the AOS. That's very unusual & rare for me, I have a mountain (1450 m. ASL) and high buildings direct to this direction.

But the surprise is not ended here. When the "Old Girl" was almost to LOS (1-2 degr.) I was able to listen my CQ CQ signal on
Downlink, very Loud ! And, after the LOS, when the Satellite was below the horizon, my signal was still audible till the --5 degrees Elevation!

I confirmed the satellite orbit with a 2nd computer, nothing wrong. It happened really that!

So, it's obvious that the "propagation" conditions are excellent today for Mode-A. Another proof is that the nice QSO between
K3SZH & IV3JER at ~ 11.25 Z, as I read on AO-7's LOGbook.

Well, try a "shoot" on Mode-A through the "Old-Girl" this evening. (Unfortunatelly I can do that, I have QRL this afternoon).

Good Luck

73, Mak SV1BSX

1177. alt az rotator

Yahoo group: eu-amsat
Date: 2008-01-01 15:41:51 UTC
From: Dominic Baines
Topic: 1177 Message: 1177

Hi,

Has anyone homebrewed an alt az rotator and controller?

I can think of the obvious lash one TV rotator (AR-303) on another or use a TV rotator for horizontal and a powered screwdriver and a long threaded rod attached to a hinging plate for vertical elevation. I am interested if anyone has worked out something else and how to obtained feedback and positioning?

A commercial rotator seems a bit too pricy.

Hi Dom and Happy New Year,

well yes, I have made Elevation system for Satellites antennas by using
TVRO actuator.
The actuator is very cheap (30-40 E) and very powerfull stuff.

On the followink Link of my page you can see several photos and a nice
video
on YouTube (created by SW1IXP) about this system:

http://sv1bsx.50webs.com/actuator/actuator.html#sw1s

If you want any additional info let me know.

1179. A2710S Antenna's problem

Yahoo group: eu-amsat
Date: 2008-01-04 01:16:59 UTC
From: SV1BSX
Topic: 1179 Message: 1179

Hi to all & HAPPY NEW YEAR,

sorry for "off topic", just I wonder if somebody here has any experience with Cuscraft A2710S (5+5 El. V-U antenna).
A friend of mine (newcomer on SATs), he used only the VHF part of this antenna as VHF Yagi on a Satellite antenna system, but unfortunately the antenna appears SWR 3:1 !
Because he removed the "Harness" which splits the common Coaxial from TX-RX into the two separate antennas (V & U) in order to use the antenna with independent Coaxial - just for VHF band (the UHF-part is non-connected), I wonder if this "Harness" has to do with antenna matching - even if this coaxial is a simple-usual 50 Ohms cable.

Thanks in advance.

Hello Mak and a Happy New Year to All

I don't know this antenna. But I would install the Harness again and look, if the SWR is OK. If not, your friend has another problem at the antenna.

Hello Mak!
I don't know this antenna to, but when I attempt to count antenna
"like this" in MMANA, I have come to conclusion what Harness is
needed. All geometry in "like this" antenna's is very critical for
size and resistance, which load/drive it. In this case one driven
element is not connected at all. It should lead strong mismatch all
antenna.
All is only my îpinion :)

Topic: 1179 Message: 1182

Hi Thomas, Igor & Group,

well, the mystery ...solved ! This antenna is impossible to work without "Harness".
My friend of mine he connected again the Harness and now the SWR is 1:1.

Any attempt without Harness, even if tried to tune the Gamma-match again & again - was without success!
That sounds very strange to me indeed, because the Harness is not 2 pieces of 75 Ohm Coaxial cables (like a "Matching stub"), it is just 2 pieces of 50 Ohm Coaxials.
So I can't understand why this significant mismatch without the Harness.

Anyway....

Thanks for replies my friends.

Hello Mak!
I don't know this antenna to, but when I attempt to count antenna
"like this" in MMANA, I have come to conclusion what Harness is
needed. All geometry in "like this" antenna's is very critical for
size and resistance, which load/drive it. In this case one driven
element is not connected at all. It should lead strong mismatch all
antenna.
All is only my ?pinion :)

1183. Why?.

Yahoo group: eu-amsat
Date: 2008-01-07 09:47:25 UTC
From: John Hackett
Topic: 1183 Message: 1183

Hrm !,
Why is it that a certain French station - (an old timer) - tunes up on top of me and the station I'm in QSO with almost everyday - on the same frequency!!!.

Surely even an old timer can remember where the tuning points are on his dial? ... write it down! for God's sake.

There is simply no excuse for this kind of operating when using full duplex.

As a CW-only station, surely he can recognise the difference between an on-going QSO and a CQ call?.

I am not !!! mistaken about the identity of the station concerned, though I have no wish to hang him out "personally" ... it's most probably *NOT* intentional ...
I recognise the signal and location very well and normally I just "accept" the wierd operating proceedure but this morning I was irritated! ... ha-ha-ha ... just blowing off steam !!! ... it will no doubt be the same on the next mode-B pass but by then I will be "awake".

Have a good day all and please forgive the "outburst" ... and waste of "bandwidth" ... he he he.

73 John. <la2qaa@...>

1184. A query.

Yahoo group: eu-amsat

From: John Hackett
Topic: 1184 Message: 1184

Hi all,
Does anyone have any current information on the whereabouts/state of the SUMBANDILA (lit: 'pathfinder') satellite that was built by Stellenbosch universdity. South Africa.

The last I heard - (a year ago) - it had gone for "testing".

This satellite with a 2m/70cm transponder was to be launched at the end of 2006 ... then May 2007 ... it is now January 2008 and I can't recall seeing any pertinent info: on any of the bulletin boards.

If anyone has any 'recent' information I'd appreciate a hands-up.

Hello John

This was the last info about SumbandilaSat:
http://www.amsat.org/amsat/archive/amsat-bb/200705/msg01524.html

If there are any news about a new launch date, you can inform
you here on my list:
http://www.amsat-dl.org//index.php?option=com_content&task=view&id=46&Itemid=102#geplant
I update this list every month.

Mit freundlichen Gr?ssen, Regards, 73

1187. A simple question about FT 847 & ham radio deluxe

Yahoo group: eu-amsat
Date: 2008-01-09 12:15:48 UTC
From: SW1JGW
Topic: 1187 Message: 1187

Dear friends,

I wish to all of you a happy new year.

I am new to this group as I am to the satellites as well.

For now I am active to AO51 and my radio is a Yaesu ft 847.

What I am trying to do is automatic Doppler adjustment with the use of ham radio deluxe software and my pc but I have only succeeded in the receiving frequency and not in transmitting frequency.

Actually the program does not control the trasmiting frequency at all.

Does anyone have any ideas?

Thank you.

Hi,

Send me a screenshot - maybe you don't have an option selected. Also please look at the help text, there may bet Ft-847 info there.

I have the same problem here. I was told the earlier version of FT-847 does not have TX control implemented in the software. Yaesu corrected the problem later and offer to change the chip for those who get the first one.

I try to find where i read this if i can get it i will send it to you. The only one way i was able to control the TX vfo in the AO-40 era was to used the up and down button to follow the beacon.

Thank you for your answers! i found the problem!
I was using the last BETA version. So in this version the option for
Main/sub VFO is not selectable. I replace the beta version with 3,4
version build 1254 and all are OK

Thank you !!!
happy new year with health and good quality of life

Hi John (& Group),

you are 100% right.... however, the problem's source is the "counting method"

on this LogBook, not the users.

It is unfair to count "1 point" either QSO, or SWL-report.

Only the QSOs should be count "points" in the total score.

The SWL-reports are useful just for season statistics.

Have a nice weekend

Hi Luc,
I beleive, that such a QSO is possible.
We have QSO vith VO1ONE (GN37ON) via AO-51 on 23.11.2005.
Mark was usind only 5 watt handheld station and dual band ARRWOW antenna.
Our mutual window was about 1 minutes, but may be even less.
Anyway, his signal was exelent and real report was 59/59.
One more QSO with Mark was in march, 2006 Also via AO-51.
But my setup was 4x9 el yagi for 145 and 4x19 el. yagi for 435 MHz.
(http://es1rf.interval.ee)
Of course, distance to you is a little bit longer, but may be we can find
a mutual window too with a carefull calculation.
My QRA-loc is KO29IF.
It should be interesting!!

1201. Observations From Norway.

Yahoo group: eu-amsat
Date: 2008-01-15 11:25:59 UTC
From: John Hackett
Topic: 1201 Message: 1201

Hello folks,
Linear satellites are getting a bit thin on the ground lately arn't they - and what with the (hopefully) temporary demise of AO-51 (a software reload) there's not much a satellite operator can do other than to make an appearance on AO-7 or VO-52.

Therefore, I wrote the following 'missive' as a suggestion, so, instead of whinging, you can can get off your bum and chuck together a small interface for your FM handheld and try some QRP operating - you just might surprise yourself.

While predominantly aimed at European operators I added this to the amsat-bb because there are a *LOT* of potential 'linear' folks among the FM operators "over there".

Do please take the time to learn a little about power budgets and aerial gain etc.

73 John. <la2qaa@...>
.....

OBSERVATIONS FROM NORWAY
LA2QAA
14 January 2008
An experiment,

As many of us are aware, the average age of Hams is creeping up and satellite operators are no exception - we're heading faster toward 'extinction' as opposed to distinction.

The much debated 'no code' exam - (to encourage more younger amateurs) - has, IMHO - had the complete opposite effect. With MSN and SMS why bother with Amateur Radio? ... the answer would be ... to do something you *CAN'T* do on your pet computer.

So what can be done to turn around the negative trend of this sad state of affairs?. I don't pretend to have all the answers ... however ...

One possible solution is to attract more of the 'FM only' amateurs onto linear satellites, to explore other means of communication so that they're not 'stuck' with the boring 'single user' solution.

The usual fly in the ointment excuse, here is ... "but I haven't got any gear capable of for example CW" ... which is of course an excuse that is as weak as 'hiss' with a capital P.

It is perfectly feasible to modulate an FM signal by switching on and off the carrier ... some people have used the PTT button to achieve this but a more elegant solution is to feed a controlled CW signal directly into the microphone input of an FM ... A.K.A. MCW modulation.

Ahh! ... anti-social behaviour you say, sending 'FM' on a linear satellite - due to the power budget, since FM is a 100% duty cycle mode ...

BUT !!! ... if one were to QRP by 25% as well as increase the aerial efficiency by 25% - (or any permutation giving the same results) - one would *NOT* be 'hogging' any more of the available transponder power than one normally would on a linear satellite.

Remember, the difference between a satellite signal at the horizon and at TCA (time of closest approach) - is quite dramatic ... (not that many people bother to regulate their power for ... "enough to do the job" ... or, as Bill used to say ... "Tis' vain to do with more, that which can be done with less".

("Bill" = William of Occam 1347).

Regular users of AO-7 will be aware that while activity has increased this last 12 months in the afternoon and evening passes, the morning passes are still for all intents and purposes devoid of any signal at all.

The increased use of AO-7 is most likely due to a lack of other 'linear' satellites, VO-52's apparent lack of activity is most probably due to the low orbit which results in an increased Doppler rate and smaller footprint. AO-7 does provide for 6500km footprints on a daily basis.

Due to above "waffling" ... I intend to conduct a few QRP FM experiments on the mode-B morning passes. If you happen to hear an AO-7 'woodpecker' you might like to try switching to FM for a moment to see if you can hear some CW.

As long as you keep your power low ... (LIMA - OSCAR - WHISKEY folks) ... QRP PLEASE ... you signal won't be any more detrimental than a CW or SSB one. Of course, you *WILL* have to take the bananas out of your ears and use them as they were intended ... to listen !!!!!.

Mark,
You said ...

<I don't see how it addresses anything specifically
<of interest to young people. Did I miss something?

I think you may have missed the point about being able to do something you 'couldn't' do on a computer with MSN or a mobile phone with SMS - (which seem to be the main tools of communication of the younger generation today).

Also ... I did specifically say ...

"I don't pretend to have all the answers ... however ... one possible solution is to attract more of the 'FM only' amateurs onto linear
satellites, to explore other means of communication so that they're not 'stuck'
with the boring 'single user' solution.

Further, I entitled the message - "SUGGESTION" - it wasn't meant as anything more than that.

BTW ... FM "bandwidth" isn't much of an issue if the transponder is
'empty' - (as I mentioned for the mid-morning passes). Excessive power is far more detremental.

James,
That's what I meant but it looks like I didn't express myself very well, sorry! - however, in my defence, I do recall I mentioned MCW.

Already had a few negative "comments" re: my suggestion but I'm an old fart and I'm *not* going to apologise for it.

I've been telling people for years !!! my last remaining active braincell is on it's last legs ... like AO-7, I only operate in sunlight !!.

As long as it's fun and I'm not doing anybody any harm nor stepping on anyones toes other than verbally - why not !!!.

Iain,

every "odd day" (15, 17, 19 Jan etc) of this month the AO-7 is active on Mode-B
and every "even day" (14, 16, 18 Jan etc) is active on Mode-A.

The switching between Mode-A & Mode-B happens at about 02:00 UTC (by internal timer of
AO-7).

You can read also the AO-7's LogBook for reports about Mode-switching:

http://www.planetemily.com/ao7/ao7log.php

Tomorrow it will be in Mode-B, indeed !

1209. C-Band receiver for P3E completed

Yahoo group: eu-amsat
Date: 2008-01-17 16:32:10 UTC
From: Thomas Frey
Topic: 1209 Message: 1209

Read at http://www.southgatearc.org/news/january2008/p3e_c_band_receiver.htm

The link "P3E Page http://www.amsat-dl.org/p3e/" is old and will not
be updated. The new P3E Page you can find here:
http://www.amsat-dl.org//index.php?option=com_content&task=view&id=37&Itemid=83
I don't know, if this page will be updated. Since AMSAT-DL has a CMS for
their sites, there grow new sites about P3E, like the site above.

The best way to be updatet about Phase-3E is the following link:
http://www.amsat-dl.org/index.php?searchword=p3-e+p3e&option=com_search&Itemid=86

BUT: Its all in German. But you can translate it online. Or you learn
the German language. ;-)

From: SV1BSX
Topic: 1210 Message: 1210

Hi all,

AO-16 is back again on... Voice!

I saw this info yesterday night on Amsat-BB and I tried today morning a test when this bird passed over Europe and it was... amazing !

Super-Duper Downlink, very Loud ! Extremely sensitive Uplink !...
but... <<<<<<Surprise>>>>>> !!!

Unusual Sat-Mode:

UpLink: 145.920 FM
DownLink: 4375.026 USB (!!!, yes it works as DSB (USB + LSB), but I think the audio is much better on USB)

Enjoy it !

1213. Confused.

Yahoo group: eu-amsat
Date: 2008-01-23 21:24:16 UTC
From: John Hackett
Topic: 1213 Message: 1213

Hi Mak and group,
I'm confused ... (the problems of getting old).

AO-16 ... is this a packet satellite or is it voice ... or both ???.

I don't see any "beacon" frequency - does it not have a beacon ??.

If someone would kindly explain what modes are being used now, I'd appreciate it.

I know it "used" to be a packet satellite. Is it only FM up and USB down on voice now ??.

73 John. <la2qaa@...>

1214. Re: Confused.

Yahoo group: eu-amsat
Date: 2008-01-23 21:38:02 UTC
From: John Marranca, Jr
Topic: 1213 Message: 1214

John:

Yes, this used to be a PacSat, but in the letter that Drew Glasbrenner, KO4MA had written, he stated that there were parameters built into the satellites firmware that allowed BASIC mode changes. (Quoting Drew: One of these commands allows an uplink receiver to be directly tied to a downlink transmitter. The twist is that the uplink is regular FM but the downlink via the BPSK transmitter is DSB (Double Sideband)

The uplink is 145.920 MHz FM.
The downlink is 437.026 (+/-) SSB.

It works QUITE well. Very sensitive receiver. VE2DWE was working it at ONE WATT today on the 2045z pass...and I use no more then 5 watts from my FT-817ND for basically everything.

Good Luck, and 73

Hi John,

no, at present time works as VOICE Sat (only).
I think that is for a test-period after the recovery of Satellite.

No Beacon. You need a stable (no Doppler correction) FM signal for Uplink (145.920) and SSB for Downlink, either USB or LSB because the Down-TX is DSB, but I think USB sounds better.
Your receiver must be tuned at 437.026 (USB) + - 10 KHz for Doppler.

Try that John, it's very sensitive and Powerful bird. Really BOOooooMING !

Hi Mak and group,
I'm confused ... (the problems of getting old).

AO-16 ... is this a packet satellite or is it voice ... or both ???.

I don't see any "beacon" frequency - does it not have a beacon ??.

If someone would kindly explain what modes are being used now, I'd appreciate it.

I know it "used" to be a packet satellite. Is it only FM up and USB down on voice now ??.

From: Thomas Frey
Topic: 1219 Message: 1219

Hello All

Here is the article of AO-16:
http://www.arrl.org/news/stories/2008/01/23/100/?nc=1

In my opinion AO-16 is not a Repeater. The uplink-signals in voice
or whatever are not processed. I mean it is technically a
"Talk-thru"-satellite now. What do you mean ?

Hi Thomas & Group,

I agree with you Thomas. The downlink audio has
unusual "fluctuation", is going stronger and stronger and stronger,
but extremely strong at the peaking, and then droping-down.

I think, the fluctuation following the Uplink fading, however
this Peaking of audio is unusual strong for Satellite Downlink.
I think that happens because as you said above:

" The uplink-signals in voice or whatever are not processed".

Probably you are right - there is nothing here, like an AGC
(Automatic Gain Control) in order to prevent the strong signals,
trying to keep the audio as stable as possible.

And really I wondering if that is good for AO-16's batteries.

But I'm surprised with this "baby" !

Just a cube 22cm, 17 years old and is still in excellent shape and....
BOOOoooming !

Why the rest Amateur Satellites are not like this "baby"?

I wondering....

For those that follow the AO-7 log. As I've mentioned several times before.

On the 23rd January JH3XCU/1 was registered with 978 points - (no QSO's).

Today, the 24th January after logging at 09:49 on orbit 51880 - (no QSO) - he is registered with 991 points.

Like the Americans say ... "go figure".

One day, no QSO, 13 points ... not bad going !! ... It kind of overshadows the "genuine" reports.

73 John. <la2qaa@...>

Topic: 1224 Message: 1224

Hello Folks,
Finally !!, I have a use for my IC-E91 D-star handheld.

(probably no D-star repeaters in 'NOG' for the next 1000 years and AO-27, the D-star satellite is never switched on over Norway).

I am of course talking about the resurrection of AO-16.

OK, it's FM up, single user to boot, but it's saving grace is the DSB signal on the downlink and hey !!, a single user 'voice' sat is better than a dead Pacsat.

It also exhibits a nice carrier so that it can be tracked with Itune for auto doppler.

The set up ihere was an IC-E91 with a *MASSIVE* 3 watts on the uplink and an ancient TR-851E multimode for the downlink.

I was *NOT* using my normal outdoor aerials but decided to "test" things using an "INDOOR" Arrow aerial in a ground floor flat - through the walls ... with no preamp.

No problem copying Russian stations at 2 degrees elevation.

(Mountains ? ... in Norway ?? ... GERROFF !!!).

This will no doubt ensure that "certain" across-the-pond stations will find it necessary to use 80 watts to a BRICK amp - like they claim to need, to work AO-7.

Seems like 'Im getting to be a dab hand at working "deceased" and resurrected satellites.

The last time I worked AO-16 was on packet with PB & PG in 1991

Thanks to "Smithy" for having the foresight to add the simple command that turned an otherwise useless piece of spacejunk back into a workable satellite.

This latest "command sequence" must certainly be an excellent design criteria for future Amsat satellites?.

1226. Konfiguration for AO-7 Mode A

Yahoo group: eu-amsat
Date: 2008-01-27 10:29:03 UTC
From: wk73ch
Topic: 1226 Message: 1226

I would like to ask the group to comment my station setup, because I am plagued with a very noisy 10 meter band where the signals from AO-7 are often buried, so that I have more or less to creep into the speaker, to hear the responding ham. I have studied all available info (observations ... et al) and probably oversee something.

I use a titanex vertical antenna GP40/10, which does a good job for normal 40 to 10 m QSO's. The 'receiver' is my trusty FT1000. I have no preamplifier.

My noise problem is probably QRN, because it is stronger in the afternoon and night. I remember, having heard my CW-CQ quite clearly early in the morning (no takers, then ;-)).

Thanks for any hint

Hallo Werner

Take a headphone to listen instead to creep into the speaker. ;-)

> I use a titanex vertical antenna GP40/10, which does a good job for

As you say, your setup is good for terrestrial QSO's. But for Mode-A
satellites you need another antenna. The radiation pattern from your
Vertical is too flat, good for terrestrial DX. I use a 1/2-wave-dipole
mounted as inverted-V with good results. also for DX in the 10m-Band.
Yesterday I had my 3rd Phone-QSO with IW6OVD via AO-7.

Werner,
I suggest you change your RX aerial to a full wavelength horizontal loop mounted somewhere between a quarter wavelength and a half wavelength over the ground.

Even if you don't have any trees, at a pinch, you can mount it "sloping" from the eves of your roof ... use nylon lone as "spacers"

Each side of the loop is 505cm. The nominal feedpoint impedance is in the region of 100 ohm so if you want to be a perfectionist you can use a quarter wavelength of 75 ohm coax (Q-match) to match to 50 ohm line. Directly feeding the aerial with 72 ohm line will give a SWR of 1.6:1 which is perfectly acceptible at 10m.

1232. Re: [eu-amsat] Correction !!!.

Yahoo group: eu-amsat
Date: 2008-01-28 13:39:59 UTC
From: SV1BSX
Topic: 1231 Message: 1232

...OK John (he he), it happens that also to me even if I am still.... young !!! (Am I really ???)

"We are people - we make mistakes" (or, as a friend of mine said: "we are mistakes and we make.. peoples" !!!).

Well, your suggestion about a "Square Loop" is good.

I was thinking the same problem with AO-7/A reception several times. Well, another solution it might be a
small Magetic-Loop. It has about 70 cm diameter for 10m Band, and we know that is extremely good for reception
on a narrow zone. Because the activity of AO-7's Downlink on Mode-A take place on 29.450 + - 5 KHz,
I think this very sharp-tuned Loop it should be not a problem for the Satellite.

On the other hand, a similar Loop is possible to place it into the crossboom,
"side-by-side" with Uplink's VHF-aerial.
Thus, it could be possible to follow the Satellite's orbit on AZ-EL, in order to minimize the "null - effect"
which happens with the "stable" aerials - like Dipoles, Loops etc.

I can't imagine something better for 29.45 MHz in order to follow the Satellite's orbit on Mode-A. The next solution
is a mini-Beam for 10 m Band, but that is a... "monster" compared with a
Mini-Magnetic-Loop.

And a few words about MODE-A reception. The majority of Hams have problems with this Downlink
Band and really, I can't understand why !

Personally I use an... "ancient" radio as receiver (Yaesu FRG 7000), which is a little-bit "deaf" on 10 m. I've made
just a simple pre-amp in order to improve the RX-sensitivity on this Band. My aerial is an old "Windom".

Even if I have this simple gear, I can hear *almost* anything through AO-7 / Mode-A. But I was looking for
the best result, by trying various arrangements again & again, for several weeks.

Now, every afternoon I have QSOs with F3ZD. Just the same with F2IL. I remember during the last days many
others like IK0DPX, DJ1TU, UA9CS, LY2BJ, HB9BNK. Yesterday I heard loud & clear: HB9SKA .
The last days with SW1JGW, Demetre, which uses just a .. CB Vertical aerial and his FT-847.
Demetre has been involved with Sats during the last month. Before 1-2 days he made a QSO with IW6OVD
on Mode-A, for first time with a foreign station on this Mode !

So I can not understand why the Mode-A is NOT very popular in Europe. It is not difficult. Just you need some
experimentation with aerials, receiver, etc. In other words, some work & skill with Hobby.

Gentlemen, the "Amateur Radio" is not just a QSO by using "commercial" equipments.

Sometimes that is not enough.

Sometimes we need to take in our hands a... solder-iron. You need to make a Loop, or a mini-Loop, or
a pre-amp... You need to experiment with all these and more... .

That is the real Ham-radio.

Otherwise, the Mode-A will be NEVER readable on your Ears.

73, Mak SV1BSX

>505cm on each side of a square loop is 2 x wavelenths.

Of course !!! it is Mak ... I told you ... I'm getting SENILE in my old age. The length of each side should of course be 250.25cm for a full wavelength loop.

Otherwise, the dimensions were correct.

Werner,
I suggest you change your RX aerial to a full wavelength horizontal loop mounted somewhere between a quarter wavelength and a half wavelength over the ground.

Even if you don't have any trees, at a pinch, you can mount it "sloping" from the eves of your roof ... use nylon lone as "spacers"

Each side of the loop is 505cm. The nominal feedpoint impedance is in the region of 100 ohm so if you want to be a perfectionist you can use a quarter wavelength of 75 ohm coax (Q-match) to match to 50 ohm line. Directly feeding the aerial with 72 ohm line will give a SWR of 1.6:1 which is perfectly acceptible at 10m.

Subject: [eu-amsat] Konfiguration for AO-7 Mode A

I would like to ask the group to comment my station setup, because I am plagued with a very noisy 10 meter band where the signals from AO-7 are often buried, so that I have more or less to creep into the speaker, to hear the responding ham. I have studied all available info (observations ... et al) and probably oversee something.

I use a titanex vertical antenna GP40/10, which does a good job for normal 40 to 10 m QSO's. The 'receiver' is my trusty FT1000. I have no preamplifier.

My noise problem is probably QRN, because it is stronger in the afternoon and night. I remember, having heard my CW-CQ quite clearly early in the morning (no takers, then ;-)).

Thanks for any hint

73

Thank you for your advices for a better antenna !

I have already started with the inverted V, but today I could not hear anyone on AO-7 Mode A (on either antenna) and now my 'receiver' FT-1000 refuses to turn the main dial. So, this is probably going to take a little more time.

I will come back to report my success as soon as it works.

Hello Mak

I was at Saturday via Mode-A active and worked also IW6OVD in phone (USB).
I'm not a CWist.

I fully agree for the rest. But not all HAMs has the place to
experiment with HF-antennas. I'm happy to have many space under
my roof. A magnetic loop will be a good idea on a balcony.

The rest is experimentation as you said.

I dust off my HF ham department as AO-7 was in mode A this morning. I was using a linear loaded dipole 42 mtrs long at 15 mtrs high in an
inverted Vee configuration with an antenna tuner. I was able to copy my downlink with a 51 52 report at the max but not enough to be able
to have a QSO probably i will better off on CW.

I remember when AO-07 resurrects signal on Mode B and mode A where much more stronger is it possible the overall performance decrease since
that time?

I don't know if a loop will beat my dipole? any advices from the experts?

1236. A considerate operating practice on FM (one channel)satellites, Europe

Yahoo group: eu-amsat
Date: 2008-01-28 20:54:38 UTC
From: SV1BSX
Topic: 1236 Message: 1236

Hi all,
This is a short version of an article I wrote in
2000 about using FM (single channel) satellites.

The reason for using bandwidth for it is that I
listened to AO-16 at the pass with AOS at 1621 UTC here
from Copenhagen. It was awful - but unfortunately
just a repetition of what has been going on for
the last couple of month on other FM satellites.

I do not think anyone made a real QSO. One particular radio
amateur counted 1 - 2 - 3 - 4 over most of the pass ??

Short version:
The golden rule - do not transmit if you can not hear the downlink.

Calling "CQ satellite" 3 - 4 or more times and give the call
and the full locator at the same time is non-productive.
It simply takes too long time. Experienced operators easily pick
out new stations using a short CQ call.
It is not really necessary to call CQ - just give your call.

Considerate operating practice allows a QSO to finish.
Many operators on the FM satellites do not adhere to this.
You very often find a station calling on top of a running QSO,
which makes the QSO take much longer time than necessary.
Often it is because the QSO takes a long time, which leads
to the next "rule".

Make the QSO short when the satellite is busy. Valid QSO's
just need to exchange calls and signal report. That is it.
You do not need locator or operator name. If there is very
little traffic OK go ahead and talk about anything - but not
when the satellite is busy.

Here in Europe we also have the habit of asking for the full lokator.
I have tried to avoid that, but I have failed in this respect.
For a terrestrial QSO or in a contest you need the full lokator -
but not for a satellite QSO.

A considerate operator will make one QSO per pass. If you are an
experienced operator, who has made a lot of contacts before -
limit your contacts to new stations.

Do not use the FM satellites to elaborate on the weather situation
in your local area, when the satellite is busy.

Give priority to portable and mobile stations if they can hear the satellite.

Give DX stations (rare calls) a chance to get through. I have witnessed JW stations being "drowned" by local QSO's.

Look at your satellite tracking program in order to avoid calling stations that are out of the footprint.

If someone is really annoying - don't try to block their signal - try to send them an e-mail especially if they are from your own country.

Also respect if people want to use their own native language. It is perfectly OK to talk Danish, German or any other language, as long as they do not carry on for many minutes.

AND no - I do not want to be a policeman on the satellites :-)
AND please no flames.

73 OZ1MY
Ib

Hi Luc, No, the signals are changeably. Last Saturday they was strong and
clear, ideal for a SSB-QSO. I have to add, I'm only QRV during the weekends
and observe only Mode-A since the 2m-beacon has failed.

1239. Re: Konfiguration for AO-7 Mode A

Yahoo group: eu-amsat
Date: 2008-01-29 00:25:57 UTC
From: SV1BSX
Topic: 1226 Message: 1239

Hi Luc,

don't give-up if your morning pass was very weak. That is usual.

AO-7 on Mode-A significantly changes between the orbits.
Sometimes the Downlink signals are good, some other times weak
(or unreadable).

Today afternoon for example, the East-pass close to my QTH was "SUPER". My
return-voice on Downlink was Loud & Clear.
Unfortunatelly I was ....me and ..the Satellite (like the old song... "me and
Mrs Jones")!

The next pass was completely different, absolutely ...terrible, very very
weak ! By using the same antenna, the same receiver, all just the same.
Even if the Elevation was about the same with the previous pass.
But even if the pass was bad, I made a QSO with F3ZD ! On CW of course.
It's strange but true.

Therefore, the Mode-A is quite unstable. So, pse try again & again in order to
listen the Satellite. May be tomorrow you have a nice pass, with good signal on
Downlink and thus you will have the opportunity for a QSO with some other Ham. If the
Downlink is good, then it is possible to make QSOs on SSB. With simple antennas.

In addition pse keep in mind:

it is very difficult for me to listen the Satellite below of 15-20 degrees (sometimes
higher).
I believe for that is responsible my Windom antenna. On HF, if you have not a Yagi,
the Beam-angle is quite High by using "wires". So, it is not right to looking for the
"Super-Duper" QSO "across the pond" when the "Old-girl" (aka AO-7) uses the Mode-A.

Another point:
I'm starting always by tuning my receiver on 29.449 - 29.454. All activity take place at
this point of PassBand. With my receiver i.e. on 29.452, I send CW beginning
from 145.895 (Uplink) and by increasing my Uplink Frequency slowly, carefully & smoothly -
I 'm looking for my return-signal on Downlink.
If I have not result, I'm starting again from 145.895, looking *always* for my
return-signal
on 29.452. If the Satellite is in my range, by using this method I have 95% access.

Good luck / Mode-A !

73, Mak SV1BSX

1240. Aerials & propagation.

Yahoo group: eu-amsat
Date: 2008-01-29 09:04:44 UTC
From: John Hackett
Topic: 1240 Message: 1240

Al,
Chuck this on Observations.

73 John.
.....
..

AO-7 mode-A notes.

Do please remember that the propagation does not *STOP* at 30Mhz. Satellite signals *ARE* affected by the propagation, though sometimes in quite a different way than on the lower HF frequencies.

At VHF, scintillation and Faraday rotation are the main culprits. Presumably, one already knows about the idiosyncracies of the propagation at the higher end of the HF part of the spectrum
(mode-A downlink).

A *DEFINATE* advantage in mode-A operating is having the ability to change the polarisation though due to size this isn't as easy as it is at VHF. You can also try changing your polarisation at VHF ... I'm talking about the difference between horizontal and vertical ... for LEO's I wouldn't even bother with circular ... that is my personal opinion ... (mucho experience on the Royal Signals test range at Warminster, Wiltshire in the 1960's ... the principles remain the same in 2008).

Do !! remember that the propagation at any given time is probably *NOT* necessarily the same at your location and at the station you're working's location. 200 miles (or more) in distance can show dramatically different propagation anomolies ... yes, honest !!.

Also ... remember that the signal is traversing the ionosphere TWICE !!.

When I recommended a full wavelength loop I did so because it is the simplest general purpose RX aerial for 10m. If you want a "dedicated" mode-A aerial, a 10m mini beam is the best option.

There's an Irish Ham's website with an excellent design but unfortunately, I can't remember the URL. A SPIDERQUAD design with a couple of bamboo poles is to be recommended. (use your browser to find a few designs).

As Mak SV1BSX commented, a compromise would be a small magnetic loop ... though in most cases, I wouldn't recommend compromise fort AO-7's mode-A downlink.

Hi Mak,

I found your description of evaluation of the current AO-7 status very informative, I will try it also.

Thanks !

73,
Werner, HB9BNK

1242. Delfi C-3

Yahoo group: eu-amsat
Date: 2008-01-31 16:11:40 UTC
From: Luc Leblanc
Topic: 1242 Message: 1242

The countdown clock is at -32 days and i cannot find any decoding software on their site? It will be a good thing if they want to have
amateur stations to decode the telemetry to make their software available a couple of weeks before the launch in a way to be able to play
with it a bit before starting to decode

Bugs, problems, incompatibility with OS "VISTA"... and so on will be better solved right now rather than the day before launch!

Radio Amateur section

Delfi-C3 will have a downlink in the amateur satellite segment of the VHF amateur radio frequency band. Telemetry decoding software will be
made available to participating amateur radio operators and universities which allows them to decode and display real time telemetry.
Furthermore, the software allows for a data upload to the central Delfi-C3 ground station via the Internet for data processing. The Delfi-
C3 team would like to invite all interested radio amateurs to receive, decode and forward telemetry data to the Delfi-C3 ground station.

Hi Luc,

as I read on the follow link "The Delfi-C3 groundstation is currently used
to receive telemetry from the PCSAT2 experiment....."

http://www.delfic3.nl/index.php?option=com_content&task=view&id=73&Itemid=111

Probably its just the same (or similar) TLM-format, so it is no necessary
a new software.

73, Mak SV1BSX

1244. Power budgets.

Yahoo group: eu-amsat
Date: 2008-02-01 09:10:12 UTC
From: John Hackett
Topic: 1244 Message: 1244

Hello folks,
For those that don't understand power budgets on satellites -
especially ailing ones - *PLEASE* make the effort to read up on the
subject - so you can honestly say "your" operating *DIDN'T* shorten a
particular satellites life ... or ... you were *NOT* being an alligator
... (all mouth and no ears) ... and using more than your fair share of
the available power.

Remember ... there are potentially many !!
users on AO-7 and the available power is distributed among them ... a
LINEAR transponder isd *NOT* like an FM transponder.

There is an
excuse for simply "not knowing" - but there is no !! excuse for knowing
and ignoring the facts - that's just plain anti-social.

If you're not aware of it, do please !!! take the time to read up on the subject.

73 John <la2qaa@...>

Oh - my - God!,

>On 70cm I run about 80-100 watts to a 40 el cp
>yagi. I can pick up my down link when the sat
>is about 7 degrees.

73 Bob W7LRD
.....
Wow!,
That's not an AO-7 satellite class station Bob, it's an EME station.

Have you not read the recommended operating proceedure for AO-7 !!.

<http://www.planetemily.com/ao7/ao7log.php>

5
watts or less to a decent aerial is adequate. Personally, I have
NEVER used more than 5 watts to a homebrew 6 element yagi but this
gave me 3rd place worldwide - (currently 5th) - when I was more active.

I
have taken the liberty of CC'ing part of your mail to the EU amsat
reflector because like me - they won't believe! the power you're using
... 100 watts to 40 elements is several kilowatts !! EIRP.

I
would respectfully suggest you do some research about *WHY* one should
maintain a reasonable power budget when operating satellites ...
afterwards - (hopefully) - you'll see what I mean.

AO-7 is not
in the best of health at at the best of times but hitting it with so
much uplink power is most certainly not going to prolong it's life.

It is also thoroughly recommended to use a "receiver" with an aerial attached - though with
your uplink power - (if it's true) -
a wet shoelace ought to suffice.

NB.

You did say 40 elements ... did you mean 4 ???.

1248. SPECIAL CONGRATULATIONS.

Yahoo group: eu-amsat
Date: 2008-02-01 17:20:28 UTC
From: John Hackett
Topic: 1248 Message: 1248

Special congratulations ought to be extended to JH3XCU/1 for soon to become the 8th station worldwide to attain 1000 points in the AO-7 log.

'Special' congratulations are in order because the station concerned has made this magnificent effort WITHOUT ACTUALLY HAVING A QSO.

Quite an acheavement.

Yes, I know it's an "activity" log but it does rather make a mockery of the log when you consider the stations that actually communicate with eachother.

Likewise the stations that claim QSO points but log the transponder as *OFF* are not helping the general statistics page.

The log page does have a link explaining how to correct incorrect entries - (the - "remember me next time" - checkbox needs to be checked).

If you're going to bother to make an entry in the log, you might as well check that you've done it correctly - and if not, rectify it ... otherwise the log won't serve the purpose as it was designed for.

1250. Tracking program VS doppler corr

Yahoo group: eu-amsat
Date: 2008-02-03 11:12:38 UTC
From: Luc Leblanc
Topic: 1250 Message: 1250

Feed up in running after my tail i give a try to a doppler tracking program on AO-16. I could be put the bar a bit too high using this one
but i ended always off by a couple of KC on the RX side (probably the same on TX uplink)

I guess i will have to play a bit with some parameters? i'm using Nova and FT-847 super control. I guess the benefits will be more visible
on the transponder type?

Thank's for your inputs and here is "another" tracking program but on line and based on your IP address

HEllo John
This email is just sent to you. I hope my explaination as to the post I made on the bb is satisfactory. As I said I am very aware of the condition of AO-7. I should have been more specific as to what I was trying to convey. The message was taken out of my intended context. You justifiably jumped all over me. So all that being said I will crawl back into the wood work, with my tail between my legs. Please let the EU-AMSAT group of this mess. My emails to them get bounced back. I hope to talk with you when we get our next HEO. I am currently building up my L band system, my old S band system from AO-40 (sobsob) is still working quite well.

John/etc
To requalify- This is my capability! I use only the exciter IC-451 1-8W. I am acutely aware of the sensitivity of AO-7. However when attempting work footprint edge to footprint edge, I did run some power momentarily to find my down link. Yes John I have read all the available information regarding the history and operation of AO-7. I trust you will take the liberty to CC this email to the EU AMSAT reflector. I should have reread my initial post to the bb, as the context is not correct. My apologies to all for the justifyable outrage this has caused. I conciously make every effort to follow all the rules written and unwritten.

I have a dream that one day this community will rise up and live out the true meaning of a HEO!!!

Here is some news from the past

AO-40 Satellite Goes Silent

NEWINGTON, CT, Jan 27, 2004--The AO-40 satellite could be in serious trouble. According to AO-40 ground controllers, telemetry from the
satellite indicated a substantial drop in voltage on the operating bus at around 0100 UTC today, and the bird went silent.

Ground controller Stacey Mills, W4SM, reported that the "extreme low voltage event" shut down the satellite's S-band transmitter and
"probably" crashed the IHU-1. In a posting today on the AMSAT-DL Web site, he indicated that the main and auxiliary batteries had been tied
together and "should be charging." He said the command team would be waiting with "fingers crossed" until the next orbit to see if the
voltage on the batteries comes up to normal levels and the IHU-1 could be rebooted and reloaded.

Is it possible to have a short in the batteries? With 2 tied together can we think that is a multiplying factor just hope it will be before
30 years...

Hi Luc

Please read on http://www.wikimirror.com/AO-40 . There you can read
"... making an eventual recovery of AO-40 unlikely." There was not
simply a short in the batteries, there was a explosion of high toxic

fuel.

But the hope dies at last...

1254. Dispelling a myth.

Yahoo group: eu-amsat
Date: 2008-02-05 10:49:09 UTC
From: John Hackett
Topic: 1254 Message: 1254

I was rather amused at a question I received the other day ... "Why wasn't Great Britain involved in space?" ... like America, Russia, Japan, India and China.

Errr ... I wonder if the words Jodrell Bank, Blue Streak, Woomera ... and in more modern times, SSTL would mean anything to the person who asked the question.

How about the "other" magician ... MERLIN - (anno 2008) ...

MERLIN = Multi-Element Radio Linked Interferometer Network.

MERLIN operates at frequencies from 151Mhz to 24Ghz. At 5Mhz the resolution of MERLIN is better than 50 milliarcseconds, (quote) ... "somewhat greater than that of the Hubble telescope" ... (unquote).

Oh, I'd say Great Britain 'is' involved in space.

Perusal of the JODRELL BANK web pages ought to dispel any myths as to whether the 'Limey's' are involved in space or not.

The Lovell telescope - (76m) - is the centrepiece of an impressive array of dishes on my old stomping ground at Holmes Chappel - it is also available with it's own "live" web pages. If "precision" - (space tracking) - is your thing I'd suggest you check out the parameters ... where "error" is quoted as ... 0.0000 in azimuth and elevation ... and the diameter of the main dish is *only* 76 meters.

The Russians asked the 'mad professors' at Jodrell Bank to help track Sputnik way back in 1957 ... was that early enough to justify a 'presence'
in space exploration?.

It wasn't just the Germans who messed about with RADAR and clandestine radios in the war, you know.

I can tell you ... when you start getting 'whacked' on the head by V1 rockets chucked at you from Germany, you start taking an interest in 'space'.

Thomas,
That's quite correct but he was also under the impression that Great Britain (as a nation) wasn't interested in space. Not so.

"Politics" do play a part - (financing!) - but there really isn't a suitable site where the all important "downrange" area is available.

The Brecon Beacons in Wales are dominated by military training grounds, likewise salisury Plain in England and I'm sure my partner-in-crime GM1SXX could give you a nyriad of reasons why Scotland is out of the loop.

That !! is why Woomera (Australia) was used for testing British rockets.

Hi John

And they was the nuclear tests done in Australia by the UK also :)

But lets throw some hot water on the subject....
Didnt the US copy the design for the aircraft that broke the speed of sound from the uk guys???

From: Dominic Baines
Topic: 1254 Message: 1258

Hi,

Through GQRP and QRP-ARCI clubs I met and have spoken with some of the NASA guys working on ISS space comms and we discussed this recently and they tried to explain it to me. The UK and many other countries that might have the capability to build launch space vehicles are far too populated to launch them and have a sizable payload rocket fall back to earth if either an equatorial or polar launch were to happen. The reason behind either a Florida launch centre is that to the East is the Atlantic and a long way before you hit land if something goes wrong and they launch that way to get the 1,000 mph+ advantage the launch path provides due to the Earths rotation. From the US west coast launches into a polar orbit means they launch the space shuttle or satellites in a South Westerly direction out over the Pacific. Most of the other country major satellite launch facilities have a similar unpopulated zone on the flightpath, like the one in French Guiana ESA use called KOUROU http://sci.esa.int/science-e/www/object/index.cfm?fobjectid=38692

The three main Russian launch centers, or cosmodromes, are Baikonur Cosmodrome, Kaputsin Yar, and Plesetsk Cosmodrome. One of the problems with the location of these is that spent Russian rocket stages, unlike the ESA or American counterparts, tend to fall on land rather than into the ocean. The arctic tundra around Pletesk (the main military launch site) is littered with debris which the locals refer to as “metal from heaven.” Residents of Dzhezkazgan, which lies close to the flight path of rockets from Baikonur, have complained that toxic fuel from crashed rocket stages has contaminated the soil and made it impossible to graze lifestock. For this reason, the latest generation of Russian rockets, including the Angara and Zenit launch vehicles, burn a more environmentally-friendly mixture of propellants.

I am sure similar conundrums faced the Indian and Chinese when looking at launch sites.

Other than Dr (?) Helen Sharman not sure the UK have had another astronaut though.

I understood we have always provided loads of the space comms right from the early manned missions either directly or as relay stations and I am pretty sure we do the same for the exploratory space probes.

UK efforts in space manned or otherwise are the result of a ESA partnership and NASA collaboration aren't they? One example is the costs and facilities required for the ISS are shared amongst the partners.

From: John Hackett
Topic: 1254 Message: 1259

Precisely Dom,
That's why I mentioned the words ... "all important downrange".

RGR re: the "Russian connection" - I've spent some time there and am well aware of the differences.

Human life is not held in quite the same regard by certain elements of the Soviet "powers that be".

BTW, despite the callsign, I'm from Crewe (!) and used to earn a bob or two by picking spuds from round Jodrell Bank every Saturday morning in the late 50's..

Subject: Re: [eu-amsat] Dispelling a myth.

Hi,

Through GQRP and QRP-ARCI clubs I met and have spoken with some of the NASA guys working on ISS space comms and we discussed this recently and they tried to explain it to me. The UK and many other countries that might have the capability to build launch space vehicles are far too populated to launch them and have a sizable payload rocket fall back to earth if either an equatorial or polar launch were to happen. The reason behind either a Florida launch centre is that to the East is the Atlantic and a long way before you hit land if something goes wrong and they launch that way to get the 1,000 mph+ advantage the launch path provides due to the Earths rotation. From the US west coast launches into a polar orbit means they launch the space shuttle or satellites in a South Westerly direction out over the Pacific. Most of the other country major satellite launch facilities have a similar unpopulated zone on the flightpath, like the one in French Guiana ESA use called KOUROU
http://sci.esa.int/science-e/www/object/index.cfm?fobjectid=38692

The three main Russian launch centers, or cosmodromes, are Baikonur Cosmodrome, Kaputsin Yar, and Plesetsk Cosmodrome. One of the problems with the location of these is that spent Russian rocket stages, unlike the ESA or American counterparts, tend to fall on land rather than into the ocean. The arctic tundra around Pletesk (the main military launch site) is littered with debris which the locals refer to as “metal from heaven.” Residents of Dzhezkazgan, which lies close to the flight path of rockets from Baikonur, have complained that toxic fuel from crashed rocket stages has contaminated the soil and made it impossible to graze lifestock. For this reason, the latest generation of Russian rockets,

including the Angara and Zenit launch vehicles, burn a more
environmentally-friendly mixture of propellants.

I am sure similar conundrums faced the Indian and Chinese when looking at launch sites.

Other than Dr (?) Helen Sharman not sure the UK have had another astronaut though.

I understood we have always provided loads of the space comms right from the early manned
missions either directly or as relay stations and I am pretty sure we
do the same for the exploratory space probes.

UK efforts in space manned or otherwise are the result of a ESA
partnership and NASA collaboration aren't they? One example is the
costs and facilities required for the ISS are shared amongst the
partners.

Thomas,
That's quite correct but he was also under the impression that Great Britain (as a nation)
wasn't interested in space. Not so.

"Politics" do play a part - (financing!) - but there really isn't a suitable site where the
all important "downrange" area is available.

The Brecon Beacons in Wales are dominated by military training grounds, likewise salisury
Plain in England and I'm sure my partner-in-crime GM1SXX could give you a nyriad of reasons
why Scotland is out of the loop.

That !! is why Woomera (Australia) was used for testing British rockets.

Hi John

And they was the nuclear tests done in Australia by the UK also :)

But lets throw some hot water on the subject....
Didnt the US copy the design for the aircraft that broke the speed of sound from the uk guys???

1261. A lot! of felines ... or ... Cat: Nr: 05580

Yahoo group: eu-amsat
Date: 2008-02-06 08:13:24 UTC
From: John Hackett
Topic: 1261 Message: 1261

Hello Folks,
Does anyone know where I might obtain keps for object nr: 1973 583A, catalogue nr: 05580 ??.

My first shot was Celestrak but the page refused to accept the previous password it used to.

(There is no facility for 'remembering' an old password).

It's simply too much faffing around creating a new identity.

Any suggestions and I'd be most grateful.

This is the first 100% British satellite launched 35 years ago. There's a video on the Amsat-UK website showing that it's still transmitting.

It was also known as Prospero X-3.

USELESS INFORMATION DEPT:

Prospero? ... Aye!, the Duke of Milan in William Shakespeare's ... '
The Tempest' ... read the play and you'll understand why the satellite was christened thus.

Hello John,
Re: the Prospero X-3 satellite.

It's object nr: 1973 583A, catalogue nr: 05580.

I've listened to the Amsat-UK website audio recording and noted the frequency as 137.560 WFM ... but I can't find any keps anywhere!.

Any ideas where I might find current keps ??.

I tried the CelestTRACK website but it refuses to accept my password since I last checked in a year ago.

The Wikipedia page noters that it was decomissioned long ago but that it's still transmitting ... with an estimated life of 100 years.

Interesting power situation there ... nuclear based ??.

If I could find the keps I could have a listen. Any other 'secret' info ??.

Hello folks,
Could the recording of what is believed to be Prospero X-3 on the Amsat-UK website on 137.560Mhx in fact be from one of the Orbcomm satellites ?.

Just a thought.

Easily checked, by running the free Orbcomm software and having a listen to the telemetry.

From: John Hackett
Topic: 1261 Message: 1264

Hi Thomas,
Thank you. I've got it all sorted out now. In fact, I suspect that which Amsat-UK have on the video as X-3 may well have been an Orbcomm satellite on 137.560Mhz ... but I may be wrong ... I havn't gotten around to checking the TLM yet.

I have the Orbcomm software so it should be easy to compare.
I put the X-3 keps into NOVA and InstantTRACK so it will be relatively easy to check - when I have time.

Thanks again for the X-3 keps.

John,
You may well be right at that.

How's Robert (G8ATE) chugging along?. I read he's been getting quite a bit of attention Stateside of late re: the Oscar anniversary award ... canny old bugger!.

FYI ... I'm in direct contact with the Amsat-ru 'remnants' (Alex himself) - or what's left of 'em. I'm trying to convince them to work on a project with GM1SXX (the other half of "the twisted pair") and myself.

You'll no doubt have fond memories of the RS series of satellites.

Many an op got his feet wet on one of those. The ROBOT's being a sorely missed feature.

Hello folks,
Does anyone happen to know the current status of Libertad-1 for APRS?.

Yesterday the Amsat status page said ??? ... (unknown).

Hello John

Libertad-1 is inactive. I observe the satellite since its launch and sent packet-beacons on 145.825 MHz (unproto CQ v 5K3L) but get never a response.

Note: Libertad-1 has the object-ID 31128 and not 31129 ! This is the ID from Polysat CP3, which its general beacon on 70cm is also inactive.

Thomas,
Thank you ... that 'is' a pity ... because I wanted to test my IC-E91 handheld rig asnd the problem is I'm completely !! blocked to my south by mountains so I can't try the ISS or PCSAT.

GO-32 passes over here but that's a 9600bps bird and it's quite impossibe !!! to go inside this handheld rig and modify it ... so I need a 1200bps satellite ... but can't find anything that passes near Norway.

The rig is D-STAR capable but there are no D-Star repeaters here either. AO-27 is a D-STAR capable sat but it's never switched on this far north.

Drew says D-Star would be "frowned" upon on AO-51 ... so I have a rig here I can't use for anything !!! satellite-wise ... apart from a low power uplink on AO-51.

What I really wanted was to be able to transmit to a satellite at 1200bps but like I said, I'm blocked by mountains to my south so the ISS & PCSAT are no good for me.

I can't find another APRS compatible bird I could transmit to.

Thanks anyway Thomas ... at least I know not to bother with Libertad-1.

The Japanese cubesats are not switched on over Europe.

Is this include all the senior U.S. defense officials?

The U.S. military could potentially use a missile to destroy the minivan-sized satellite in space, but one senior U.S. defense official told Reuters that was unlikely for several reasons, including concern about creating space debris, as China did when it shot down one of its satellites last year.

read the rest at:

http://www.msnbc.msn.com/id/22857051/

>Yes, because the media are clueless and don't take the time to
>investigate anything about details.

And the folks named below?

The ramifications of the operation are diplomatic as well as military and scientific, in part because
the United States criticized China last year when Beijing used a defunct weather satellite as a target
in a test of an antisatellite system.After their test, the Chinese said that they had no intention of getting
involved in a "space race" and that their test had not been designed to intimidate. Under the Bush administration,
the United States has asserted its need to protect its interests in space. President George W. Bush ordered the
military to try to destroy the satellite because "there was a possibility of death or injury to human beings beyond
that associated with the fall of satellites and other space objects normally, if we can use that word," said a deputy
national security adviser, James Jeffrey.

The rest here: http://www.iht.com/articles/2008/02/14/america/spy.php

What the worst case scenario will be? In some recent case below some pieces are making it to the ground. "Some vaporized" but here in
Canada we gets some pieces of a soviet ocean reconnaissance satellite cosmos 954 scattering debris with his nuclear fuel motor over the
northwestern Canadian territories here is the link relating the event:

http://www.hackcanada.com/canadian/other/cosmos954.html

The columbia accident

Columbia, which had been due to land at 0916 (1416 GMT) was returning from
a 16-day mission orbiting the Earth and was in its re-entry procedure when contact
was lost at about 0900 local time.

Nasa said the shuttle was about 200,000 feet up and travelling at 12,500 mph (20,000 kph) at the time.

Map showing approximate area where shuttle debris has come down
I could see two bright objects flying off each side of it

Eyewitness in US
Click here for more eyewitness accounts
Television pictures showed a vapour trail from the craft as it flew over Dallas.

It then appeared to disintegrate into several separate vapour trails, and witnesses in the area
said they heard "big bangs".Texas public safety department spokesman Clive Kennelly said there
were more than 2,000 debris fields, scattered from the small town of Nacogdoches about
170 miles (290 km) south-east of Dallas, to the Louisiana border.

Nasa has warned that any debris found should be avoided as it could be hazardous, and that people
should report such finds to the authorities.Pieces of debris have been reported in fields and on roads,
and one Nacogdoches resident, Jeff Hancock, said a metal bracket about a foot (30 centimetres) long
crashed through his office roof, the Associated Press news agency reported.

Last year I just pass nearby the Culumbia pieces burial site. An old minuteman missile silo in Cape Canaveral AFB and i was told privately

by one tour guide officer who was working on the site at that time that huge pieces of the orbiter where taken out from the ocean floor but
this was never reported by the press as they are still containing pieces of human remains? Was he making a show to the gallery i don't know
but he managed to let me pass a mobile military check point with his military clearance pass who bring us at a bird view of STS-118 launch
pad!!!

1274. ARLS003 Astronauts Work on Columbus Lab on the ISS

Yahoo group: eu-amsat
Date: 2008-02-15 22:05:03 UTC
From: SW1JGW
Topic: 1274 Message: 1274

ZCZC AS03
QST de W1AW
Space Bulletin 003 ARLS003
From ARRL Headquarters
Newington, CT February 15, 2008
To all radio amateurs SB SPACE ARL ARLS003
ARLS003 Astronauts Work on Columbus Lab on the ISS

Astronauts aboard the International Space Station complex arefocusing on getting the new Columbus lab up and running. Columbus,the laboratory built by the European Space Agency (ESA) and host oftwo Amateur Radio on the International Space Station (ARISS) antennas, was launched into space on February 7 aboard the spaceshuttle Atlantis, arriving three days later. According to NASA,Columbus' activation process has been running a little behindbecause of computer problems, but flight directors believe they'vefixed the glitch. In 2007, the ARISS antennas successfully passed electrical and SWRtests, with one of the two antennas, Antenna 42, going through afinal test -- a thermal test under vacuum. Columbus will house anadditional Amateur Radio station, including the first digitalAmateur Radio TV (DATV) station in space, as well as a ham radiotransponder. The yet-to-be-built Columbus amateur gear willfacilitate operation on new frequencies that will make it possiblefor ARISS to establish wideband and video operations for the firsttime and allow continuous transponder operation. According to ARRL ARISS Program Manager Rosalie White, K1STO, "TheARISS-Europe Team has been holding meetings to determine what theARISS International Team should have for a station in the Columbusmodule. The Europeans will need to begin fundraising for themultiple sets of equipment, such as the on-orbit equipment, therequired back-up on-orbit equipment and the test equipment." She continues, "Some portions of the equipment system can bepurchased, but much of it would need to be built. Once the teampurchases or builds the equipment. Next comes the special testingfor space and getting the equipment certified (probably by ESA) andfinally manifesting the system for launch. All of that will takemany months and help from ARISS volunteers from many countries." The mission, STS-122, brought seven astronauts to the ISS: CommanderStephen N. Frick, KD5DZC; Pilot Alan G. Poindexter; MissionSpecialist Rex J. Walheim; Mission Specialist Stanley G. Love;Mission Specialist Leland D. Melvin; Mission Specialist HansSchlegel, DG1KIH, of Germany, and Mission Specialist/Expedition 16Flight Engineer Leopold Eyharts, KE5FNO, of France. Flight EngineerDan Tani, KD5DXE, already on board the ISS, will depart whenAtlantis returns to Earth; Eyharts will stay behind on the ISS andtake his place. Atlantis will remain

at the ISS until February 18, making for a13-day flight. Touchdown is set for February 20.NNNN/EX

Hi Alan

When i wrote "Is this type of orbit can be a solution for the next HEO?" i was reading that the AMSAT´s main missions which include the
geosynchronous Phase IV Lite rideshare opportunity with Intelsat will do exactly what you said above " I would suspect that a 'tundra-
inclined orbit', fixed over the US as the Sirius Radio Sats are, would not be as internationally well supported."

How much of the international funds given to AMSAT-NA by the various international contributors will be diverted to the intelsat project?
and how much of the very restricted humans ressources will also be diverted to this project detrimental to the others?

On February 7 2007 the following document has been signed by Peter DB2OS, Rick W2GPS J, Jim G3WGM

Memorandum of Understanding between
AMSAT-DL, AMSAT-UK and AMSAT-NA

AMSAT-DL for the last five years has been building the P3-E spacecraft to be launched into a HEO and intended as a replacement for previous P3 satellites. It's purpose is to facilitate communication between radio-amateurs worldwide and at the same time to test and verify technologies and procedures needed for the P5-A mission to Mars. AMSAT-DL to this day has invested about 500,000 Euro into this project.

AMSAT-NA and AMSAT-UK wish to contribute to the P3-E project, primarily with the goal to have the launch of P3-E as early as possible in order to give to their respective members the use of the communication services provided by P3-E.

It is recognized that the capability of AMSAT-DL to raise funds limits the speed of the development of P3-E. In order to make a launch possible in 2008, AMSAT-DL has an immediate need of 40,000 Euro and an estimated need of ~200,000 Euro prior to the actual launch-date. AMSAT-NA and AMSAT-UK wish to help with the raising of these requirements by providing 30,000 Euro (AMSAT-NA) and 10,000 Euro (AMSAT-UK) in the near future. Furthermore, they wish to contribute by raising additional funding as the actual launch arrangements materialize. In order to achieve an effective cooperation in the funding effort and the construction and launching of P3-E, the following details to implement the cooperation are agreed:

1. The three AMSAT organizations will closely coordinate their activities and monitor progress of the project by frequent mutual consultations on the telephone. To this end the three parties will hold nominally a monthly telephone conference to review the status of the project and to identify problem areas. At this time the three organizations will be represented by Rick, Jim and Peter at these telephone-conferences.

2. According to need, the three organizations agree to hold sufficiently frequent meetings in person to review the project status. These meetings are assumed to be desirable with a frequency of 6-12 month between them.

3. It is understood by all three organizations that procuring a timely launch for P3-E is one of the bigger challenges of the project. AMSAT-DL is concentrating major efforts of procuring a launch with Arianespace, while AMSAT-NA is trying to develop a launch opportunity within the USA. All parties recognize that major progress in funding is contingent on a firm launch agreement. All parties further recognize that a timely construction and integration of P3-E is critically dependent on all parties giving highest priority to fulfilling their respective commitments.

4. All three organizations understand that funding progress is dependent on effective information dissemination worldwide. To this end the three organizations reiterate their mutual agreement that each organization can publish all P3-E related publications of the other two organizations in their respective public organs without special permission. Furthermore, each organization is free to prepare 'official' statements about the project, but these publications must be agreed with the project management of P3-E (AMSAT-DL) prior to publication. Requests for agreement to publish will be sent to Peter (or another person chosen by him), who will use best efforts to respond within 7 days with an answer. With other publications by individual authors no such agreement is necessary provided that the context makes it is clear that the publication is not an official declaration by the project management or AMSAT-DL.

5. AMSAT-DL reiterates that the operational use of P3-E will be primarily to provide amateur radio communication services. But all parties also understand that the spacecraft is a dual service satellite, and that AMSAT-DL retains the right to occasionally reduce the provision of amateur radio services if work towards P5-A requires this. A-DL will use due diligence to minimize the impact of the P5-A requirements on the provision of amateur services.

For AMSAT-DL For AMSAT-NA For AMSAT-UK

Peter DB2OS Rick W2GPS J Jim G3WGM

In the scope of this agreement i believe the two europeans AMSAT'S where consulted and they probably actively supported this AMSAT-NA
intelsat project? But from my point of view it looks like some sort of treason? But with any choice of target of opportunity it is very
easy for some to not even respect their own signatures...

I send you this message directly and also on EU-AMSAT YAHOO GROUP as the AMSAT président Hambly wrote me on April 7 2007
and i quote him

"Your messages will now be moderated. Any messages containing political
content, even if somehow justified as satellite related, will be rejected.
So will messages where you violate people's privacy by posting their private
messages. Any messages considered inflammatory will also be rejected.

I am sorry to have to take this action and I do not wish to create conflict
but your messages are being read by people in a position to be very helpful
to AMSAT's ability to build and launch satellites and they are not pleased.
If you wish to criticize this or any other AMSAT action, please direct those
comments to the responsible individuals rather than the AMSAT-BB list.

Rick
W2GPS
AMSAT LM2232"

As he or she the AMSAT-NA censor in chief (Who he or she supposed to lived in the best democracy in the world...;)) in the back of his
closet will probably block this one again i just hope November 2008 will send a fresh new breeze pushing away this awful rotten smell...

It is an outsider opinion but on the internet we are now living in the same life even if some choose to live in a second one!

1278. S-band.

Yahoo group: eu-amsat
Date: 2008-02-24 11:47:34 UTC
From: John Hackett
Topic: 1278 Message: 1278

Hi All,
I note that AO-51 is in V/S followed by L/S mode until the end of February.

Before braving the elements (full storm today) and "throwing" up a 20 element helix with 2.4Ghz - 70cm converter mounted on the rear I thought I'd ask if there is any activity on AO-51's S-band downlink on 2401.200Mhz FM over Europe ??.

If not, it would be a complete waste of time.

73 John. <la2qaa@...>

No, try it John. The Mode is V/US, so you can hear the same on S-
as on U-Downlink.

I have no luck with my 1.2 meter Dish with RHCP helix-feed. The antenna
is under my roof and AO-51 transmits only with about 400 mW. I think this
and RHCP vs. linear polarisation is the reason, why I can hear nothing.
The last S-Downlink I heard was from UO-11 and my own generator of course.

Hi all

I completely disagree with Thomas.

I can hear the S-Band downlink very-very strong, just by using my "Patch-feeder" - without Dish !

The Dish is not necessary as the Downlink signal is ...Booooming on S-Band.
On the other hand, the standalone Patch-feeder has much more wide lobe, and that is very usefull... you don't need to follow the Satellite "degree by degree" as happens with the Dish.

Therefore, it is not a waste of time at all dr John. The only problem it's the "sharp" Doppler effect, if you havn't an auto-Doppler correction system.

73, Mak SV1BSX

PS: for the history, I am using a CalAmp 31732 "modified" DownConverter (2.4 GHz => 145 MHz) and a homebrew LHCP Patch feeder (by K3TZ).
That's all my system for S-band.

Hi Mak

My last S band test here was producing exactly what you said with a BBQ grill antenna. Very strong signal but with very deep fades up to a
point where i cannot copy in those dip. Do you experience this with your patch element? I have one already installed but not connected on
the tower but as John says we are still in winter at our latitudes and i don't want to play outside just for the fun of it...at minus 15C.

Thank's for your answer

>
OK Mak, I know, a Dish _under_ a roof is not the optimum. But on Mode-L
it works with 10 meter of a thick coax and 15 W power, also via AO-51.
The roof is not isolated.

I agree if your antenna has free sight to the satellite. The time will
come with more satellites with a S-Downlink to experiment.

I use LHCP helix feeds (not RHCP) and a SSB downconverter.

Can you tell me the exact Downlink-QRG +- Doppler from AO-51 Mode-S
please ? I'm listening on the published 2401.200 MHz.

Thanks and 73

A big thank you to everybody who replied to my S-band query.

Very much appreciated indeed.

Luc obviously knows the WX conditions here hi ... We're not all as lucky as Mak in Sunny Greece ... but these gale-force winds wouldn't do Aldert's 'rotor' (the windmill) much good.

Thanks again Gents.

73 John. <la2qaa@...>

Luc,

it's impossible to avoid completely the "deep fade effect" on the AO-51, even if used a CP Patch.
That is 100% sure because the Satellite is spining and tumbling, so the polarization is changing and due to the S-band, the effect is much more noticeable.

For example, by using a LHCP Patch as RX antenna we have the following scenarios:

*When the AO-51 signal is LHCP is the best RX condition (pol. matching).
*When the AO-51 signal is Linear polarized (Horizontal or Vertical), in both cases the Loss is -3 dB
*When the AO-51 signal is RHCP the Loss is -20 to -30 dB.

By using a dipole (ie Horizontal polarized) as RX antenna we have:

*When the AO-51 signal is Horizontal polarized is the best RX-condition.
*When the AO-51 signal is Vertical polarized, the receiving is -20 to -30 dB.
*When the AO-51 signal is Circular polarized (RHCP or LHCP) the receiving is -3dB.

So, as abovementioned there is not a significant benefit with Patch. Theoretically in all cases you have 25% odds for a "deep-fade effect".

However, I have not your problem in order to copy the Satellite, because my receiving signal on my 2 meter RIG is usually 9+++. If a deep-fading occurs, I have just a smaller deflection on my S-meter but, I can easily copy the Satellite, without problem.

For the history, I remember a few months ago a story. I had placed on a tripod my S-Band gear on my backyard , and I made 2-3 QSOs when the Satellite was high enough in Elevation.

The funny was that, the ON5NY completely ...surprised (!) when I said to him my working-conditions from my Backyard - without a Dish, around the high-walls of my neighbor buildings !

73, Mak SV1BSX

Hi Thomas,

I am using "LHCP Patch" not because that is the optimum, but just because this Patch was made & placed on my Dish for AO-40 reception (which it was RHCP). As the Dish inverts the polarity, we need the opposite polarization on the feeder.

I can't say exactly the QRG... my DownConverter is drifting high enough the first hour of operation due to XTAL thermal-instability and the frequency on my VHF-IF also varying (x 256 times = multiplier) depending upon XTAL's inaccuracy.
But I am not worry about, as it's not necessary to know the precisely QRG... when the Satellite is "in my range", just a "rolling" on my frequency-Dial is enough to find the... Booming downlink. My S-meter spectacular rising, if the Sat-frequency is close.

But the Doppler is about ... 50 KHZ ! And sometimes on overhead passes - when the Doppler is very sharp & fast, it's very difficult to tune my receiver indeed, even if used 1 KHz step. That is true.
May be it's more comfortable a 5 KHz -step, but I have not try it yet.

From: John Hackett
Topic: 1287 Message: 1287

Mak, your postings re: the patch gave me an idea.

I was thinking of using my portable 20 turn helical on a plastic tube for AO-51 but it would probably be a bit too sharp with that amount of gain... also, it would entail aerials in both hands ... (uplink/downlink) ... then I thought, if the downlink on S-band is that strong that you use a patch without a dish, maybe it's possible to integrate a patch onto the Arrow ... on a sub-boom, above, below or beside ... thereby, one hand only operation.

(The madman strikes again).

I have seen lots of patches on various websites but wonder which particular version you are using ?.

I have a mobile phone mount attached to the back of my Arrow and have the 'SATme' tracking program on my mobile phone so I can see the Az: , El: and doppler at all times while I'm pointing the aerial ... an advantage on S-mode .... though I must admit, I havn't operated S-mode since the demise of AO-13 but I do recall the dopplerrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrr

1288. Question from a new member

Yahoo group: eu-amsat
Date: 2008-02-24 21:50:46 UTC
From: Pete Badham
Topic: 1288 Message: 1288

Evening all,

Joined the group this evening, so busy running through the information on here.

Our club has just received a nice fat cheque from the national Lottery awards for all scheme, and we have allotted about £1200 for sat antennas etc etc.

Now, unfortunately none of us are satellite experts by any stretch of the imagination, so I will be asking quite a few questions I can assure you. Our plan is to operate and demonstrate Amateur Radio to Joe Public, youth groups, school children etc and sat communication sits quite high on the list. We have a small box type trailer which we are planning on modifying to take the sat antennas on the roof section. We are aiming on making it as future proof as we can i.e. while we have the money to do so.

Now I am ok with the rotator system, we are going for a Yaesu G-5500 Mounted on a collapsible frame on top of the trailer, the antennas however are a different thing altogether. We had considered one of the hy-gain Oscar set-ups the DB-218 if I recall. I would like you opinions on this system and any ideas you can throw into the pot too. When I mentioned future proof, I was also referring to the various AMSAT activities and launches in the future too.

Any help gratefully received

Pete G0WXJ

Hi again,

yes John - is excellent idea. However this arrangement with S-Band onto an Arrow has been made a few years ago by Mark, VO1ONE (...sorry John - you have lost the "patent" !!).

http://www.freewebs.com/vo1one/sband.jpg

BTW I remember that, we had spent a lot of time on ON4KST's chat room, in order to explain to Mark
the construction details of a T-Bias! Finally he made it and with this system he spoke several times with European
stations. He was very active for a couple of months on FM Satellites - always /Portable, but after that...
nothing ! Disappeared !

==========

The PDF-file of my Patch-feeder that I'm using is here:

http://sv1bsx.50webs.com/Ao40/pdf/Patch_K3TZ.pdf

==========

As I remember from the "good old days" of AO-40, it was another Patch (by W0LMD)
with superior characteristics, but I did not make it in order to compare it with that of K3TZ, as the
AO-40 suffered the well known damage. You can find the PDF-file on the following Link:

http://sv1bsx.50webs.com/Ao40/pdf/Patch_W0LMD.pdf

Hope this helps.

From: wk73ch
Topic: 1226 Message: 1292

I am coming back to my original question and the helpful advices from the group. I have tested AO-7 Mode A with a Inverted-V for 29.45 MHz and I cut the loop (suggested by LA2QAA), but the results are not overwhelming. The titanex-vertical is equivalent to the loop. I heard several stations on orbit #52298, but had to turn the volume control of the FT-1000 to full power - the S-Meter never moved.

Should I build a preamp as next step, although the noise-level is already quite high ?

I will do another test with a ham friend, which has a magnetic loop (mentioned recently here).

Could it just be, that I live in a very noisy environment (without knowing, hi).

Thanks for your thoughts !

Hello Werner,

as I wrote on a previous post here, I am using (always) a pre-amp for 10m.
It's a homebrew stuff, nothing expensive but I have excellent result with
that.
The LINK is:

http://sv1bsx.50webs.com/28mhz_pre/28mhz_pre.html

I don't know if in your case the result is better or not, as you mentioned
your "very noisy enviroment".

I can say just my experience: without this pre-amp it's impossible to hear
the AO-7. Definitely. But my receiver is not an ..FT1000 !
It's just a vintage receiver by Yaesu (FRG 7000) which is a little-bit
"deaf"
on 10 m. Band.

So I'm thinking that, if your receiver is very "sensitive" and you can not
hear
the Satellite from your "poor antenna", in this case yes, the noise on your
receiving system it could be worst by using another pre-amp stage.

The best scenario is to add the pre-amp not in Shack, but "just" behind of
your
antenna (I mean in the roof - behind the Antenna's "feed-point").
Thus, you have the great arrangement and I am sure, the receiving it
should be much better. But that is not very easy, indeed. You need
a water-proof Box and some T-Bias in order to be able to feed the
pre-amp through the same Coaxial cable.

And, this way just forget the ..TX ! It's only for reception that.
If you press the MIC, then your pre-amp will be a nice... toast,
baked by ... 100 Watts RF power !

Finally, before any experiment or pre-amp construction, keep in mind that:

you have just about a month to enjoy the Mode-A every 2nd day, as the
AO-7 comes again to eclipse-period at the beginning of May 2008.

Good Luck.

73 de Mak, SV1BSX

1297. S-band test gear.

Yahoo group: eu-amsat
Date: 2008-02-27 11:22:53 UTC
From: John Hackett
Topic: 1297 Message: 1297
Attachments: 1 described; binary payloads are missing from this source WARC

OBSERVATIONS FROM NORWAY. February 2008.

Based on SV1BSX's comments about receiving a *THUNDERING* signal from AO-51's S-band transmitter on a patch antenna 'without' a reflector - I decided to chuck together a few components to see if somebody as 'thick' as LA2QAA could manage it.

The attached pic is the ... 'fruits of LA2QAA's labour'.

Starting at the top right we have a silver covered brass plate 2.4Ghz patch antenna (note the real gold SMA connector, folks) mounted 3mm over a (ditto) groundplane, via a short length of high quality (fell off the back of a North Sea Oil industry lorry) coax feeding the input of a 2.4G 70 70cm converter ... the output of which goes to the IC-E91 dual mode handheld and a pair of 'cans' ... (headphones, to you!).

To the right of the IC-E91 is a Nokia N70 mobile phone - (not shown in this pic because I was using it to take the picture) - with the 'SATme' tracking software ... which is very !! useful for tracking S-mode signals from LEO birds with the 'slight' doppler thus received.

The phone also contains a compas as well as GPS software so there's no excuse for ... 'but I can't find north' ... (not always easy in 3 feet of snow, null visibility and cloudy conditions) ... and there's *NEVER* a brownie or a girl guide around when you want one.

S-band signals in those conditions? ... you'd be surprised - we don't all live in satellite friendly climes you know.

Mak (SV1BSX) is right. A 60cm dish is overkill for AO-51 mode-S ... though of course, there are! those that think you need a personal
Jodrell Bank to hear anything above 70cm.

Mak,
I can assure you the patch *IS* correct.

The photo is taken from the rear, what you are seeing in the photo is the 'rear' of the reflector and the back end of the gold SMA connector.

The radiator - (hidden by the larger reflector, in the photo) - is connected to the pip of the SMA connector and is mounted 3mm 'above' the reflector.

The radiator is 'cut' for 2401Mhz and is made from silver plated brass sheet ... bas is the reflector.

I think what may have fooled you is ...

1) Not realising you were looking at the rear of the patch.
2) The fact that my reflector is square, not round.

The G3RUH design uses a round reflector, the K3OE uses square.

As far as I can assertain there is no practical difference between the designs.

73 John. <la2qaa@...>

Hi John,

I read your post but I am afraid that, your
PATCH is not correct. Sorry if I am wrong, but due to non-clear photo I
can see
on the Left-UP part of photo ONLY
the "drive element" of Patch (the square-piece with cut-corners) without
the "circular piece" behind of drive-element which acts as
reflector.
As I see also in your photo, the chassis-connector is
mounted on this square piece and not to the
circular reflector.

If that is not my... illusion, that is not a
correct Patch. I send you a clear photo to take a view how is the
complete Patch by viewing that from the front-side.

73, Mak

Subject: [eu-amsat] S-band test
gear.

OBSERVATIONS FROM
NORWAY. February
2008.

Based on SV1BSX's comments about receiving a *THUNDERING* signal
from AO-51's S-band transmitter on a patch antenna 'without' a reflector - I
decided to chuck together a few components to see if somebody as 'thick' as
LA2QAA could manage it.

The attached pic is the ... 'fruits of LA2QAA's
labour'.

Starting at the top right we have a silver covered brass plate
2.4Ghz patch antenna (note the real gold SMA connector, folks) mounted 3mm
over a (ditto) groundplane, via a short length of high quality (fell off the
back of a North Sea Oil industry lorry) coax feeding the input of a 2.4G
70 70cm converter ... the output of which goes to the IC-E91 dual mode
handheld and a pair of 'cans' ... (headphones, to you!).

To the right
of the IC-E91 is a Nokia N70 mobile phone - (not shown in this pic because I
was using it to take the picture) - with the 'SATme' tracking software ....
which is very !! useful for tracking S-mode signals from LEO birds with the
'slight' doppler thus received.

The phone also contains a compas as
well as GPS software so there's no excuse for ... 'but I can't find north' ...
(not always easy in 3 feet of snow, null visibility and cloudy conditions) ...
and there's *NEVER* a brownie or a girl guide around when you want one.

S-band signals in those conditions? ... you'd be surprised - we don't
all live in satellite friendly climes you know.

Mak (SV1BSX) is right.
A 60cm dish is overkill for AO-51 mode-S ... though of course, there are!
those that think you need a personal
Jodrell Bank to hear anything above
70cm.

....OK my friend John, don't .. shoot me! I said, your photo is not clear enough.

The only objection that I have is about the cutting-corners of reflector. That is necessary only
on the Patch, NEVER in a square reflector. So, I was confused from this detail.
I was thinking that is the Patch and not the reflector.

The reason for the 2 cutting-corners it's just a "combination" in order to achieve Circular Polarization by building the Patch with 2 different resonance frequencies in orthogonal directions. The so-called corners truncated Patch is a technique widely used on GPS antennas. I don't know if you following precisely the Patch-model of K3OE and if his version
uses a reflector with cutting-corners, but if that is true, sorry - and don't blame me, but I completely disagree with this version.
It's absolutely wrong a reflector with cutting corners and may be that it's a problem for the Patch's efficiency.

Mak,
Yes, right again ! - you obviously know more about patch antennas than I do. The reason the corner is cut on the "13cm" reflector is because it is/was part of a dual bandpatch antenna (but shown here without the 23cm part) where the 13cm REFLECTOR is also the 23cm RADIATOR ... otherwise, as usual, we're in total agreement.

1304. RE: AO-7 Log

Yahoo group: eu-amsat
Date: 2008-03-02 12:41:09 UTC
From: John Hackett
Topic: 1304 Message: 1304

Hi Ron,
Rgr ...

Bob's a mate of mine ... like me, he's no computer geek so a bit of finger trouble is to be expected - no big deal.

I administer and correct the log for a number of years but stopped several months ago - it was taking up too much time ... I was just pointing out that the ensuing accumulative errors over time will ensure the statistics page will be incorrect.

73 John. <la2qaa@...>

Subject: AO-7 Log
To: la2qaa@...

Hi John:
Just to comment about your post on amsat-bb about W7LRD and N6PAA QSO.
There should be one log entry for our 01-Mar-08 QSO on AO-7. I don't know
what Bob was thinking with the 3 log entries a few minutes apart.

73 and Thanks,
Ron
n6paa

1305. Incorrect log entries.

Yahoo group: eu-amsat
Date: 2008-03-02 16:59:00 UTC
From: John Hackett
Topic: 1305 Message: 1305

Gentlemen,
PLEASE !!!!! refrain from putting 'CQ' in the QSO pane of the AO-7 log ... it just makes the statistics page incorrect.

If you have an actual QSO - by all means log it - but please *DON'T* put CQ there.

99.9% of the operators can do it correctly - (the instructions are clear enough) - with a little bit of 'extra' effort even *YOU* could do it too.

Please don't be a sheep and put CQ because some other clown did it first.

SV1BSX asked politely, and was ignored - the actual QSO's determine the statistics ... which is the whole point of the log.

We *DON'T* need to know you called CQ on a particular date and time.

Thank you.

73 John. <la2qaa@...>

1306. More AO-7 log.

Yahoo group: eu-amsat
Date: 2008-03-04 08:17:25 UTC
From: John Hackett

Mak,
Despite our repeated requests ... yesterday ...

W7AIT 15:49
W7AIT 15:50 ... (seperate QSO's)
PY4AJ CQ
VK4ZQ CQ

Like I mentioned ... don't these people 'look' at what they write? ... or note how those that fill in the log correctly do it? ... or even read the Amsat mail?.

What can one do?.

Statistics are no use to man nor beast if they're incorrect - and over the first 3 months of this year there are enough errors to ensure that the statistics *ARE* wrong ... agreed, they're only small mistakes and agreed that - "it's only a hobby" - but what is the point in filling in the log in the first place if you're not going to do it correctly?.

Having pointed out the errors once, twice and three times on both bulletin boards in the last 14 days I assumed that ought to be enough - obviously it wasn't ... so I don't know about you but I'm not going to bother anymore.

Since the main "contenders" are English speaking one cannot blame the language. The panes are clear enough and cannot be misconscrued. The hour glass is self explanitory - you yourself have explained more than once how to fix things if they do occasionally go amok - (data is "data") - I'm referring to the - 'remember me' - checkbox issue.

It's a pity such a useful resource is allowed to become a mess.

EOR ... (End of rant).

73 John. <la2qaa@...>

Topic: 1306 Message: 1308

Hi Thomas,
Sound advice indeed!, I just might take you up on it but I suppose then I'd be accused of being a 'stick-in-the-mud' when really, I'm only trying to do what's best for everybody's benefit.

It's a lose - lose situation hi ... but I won't let it get to me.

Thanks for the encouragement Thomas.

I've batted your comment Stateside, you never know, after the 5th attempt, the message just might sink in ... ha-ha-ha ... but I'm *NOT* going to hold my breath.

Hi to the group.

Food for thought?.

After more than 17 years, the LO-19 beacon is still going strong.

Check out the parameters - (see attached file).

73 John. <la2qaa@...>

1310. Good ideas for the AO-7 log.

Alan,
A timely and intelligent mail - nice! one.

I played at super dooper pooper scooper - (log cop) - for a couple of years but it was as you correctly percieved taking up too much of my time.

I wused to be Emily's page administrator but since she disappeared into the burrow of 2nd Life and despite "millions" of 'carrots' - (read: e-mails) - I've lost contact with her.

I do wish she'd pop her head out with a quick - "What's up Doc?".

I'm now involved in other aspects of the Grand Old Lady ... AO-7, not N1DID.

Hello Kostas

Here you can find all of Mike Rupprecht's decoders:
http://www.dk3wn.info/software.shtml

The site is written in German, but the software is written in English.

Oyez!,
I'd forgotten why it was I tended to avoid FM satellites like the bubonic plague ... hey!, back off - I did have a QSO on AO-51 once and two !!! on AO-27, 10 years ago.

Anyway, this morning I decided to see if things had changed so I fired up my trusty (and otherwise totally useless) IC-E91 and 'arra' aerial ... OK !!!!, antenna.

Stepping out into the 33.9cm of 'manna from heavan' (snow, to you!) I aimed my pointed stick at the sky like any intellegent person would do (!) and tried the age old tricks of ... portable ... JP33WB ... Frei Island ... (not all at once of course).

After only a few minutes I 'remebered' ... it isn't the FM satellites that are are fault ... though they are not the 'smartest' things for amateur radio communications ... it's those operators who call without actually listening who muck it all up.

What *is* the point of calling somebody while they're actually speaking to somebody else ??? ... I'm so THICK I can't figure out how this works ... (on FM) ... maybe somebody with a few more braincells would like to enlighten me as to the theory behind this technique.

I'm quite familiar with 'tailending' while QRP operating but calling somebody while they're speaking ... (on FM) ... I havn't figured out yet.

However ... "each to his own" ... and that's how it should be - but I'll stick to LINEAR satellites thank you very much.

Hi,
Looking at the two attached LO-19 TLM pics it's interesting to note how stable LO-19 is after 17 years ... with the exception of the temperatures and that is for the very obvious reason of two different sides of the earth on different days.

Probably, that any part of data will be gone. But I think, that not so much.
A question in the one who will write the program for work with this base?
I could find a place with a suitable name (for example oscar7.net, oscar7.org) and which support MYSQL and PHP4/5 :)
In this case becomes possible:
To find the new Administrator who will have full access to a site.
Count QSO/Points or any other position in the log, like we need (As we shall explain to the Administrator), e.t.c.
It is necessary to do it on a noncommercial basis. I, for example, can find a hosting.

Igor,
A good idea but I'm not sure about eventual copyright issues.

I am the 'official' administrator of the AO-7 Resource Page Log but the problem is - I cannot do anything without N1DID's -
(ex: W0EEC) - permission since she (exclusively) holds the original copyright.

The whole problem stems from the fact that N1DID "disappeared" into SECOND LIFE and doesn't answer her mail.

My editing privilages which were normally renewed every 1st January with a cookie - have been suspended due to the lack of contact with N1DID so there's nothing I can do to edit the mistakes like I used to.

A pity, but such is the situation.

John, copyright about what??
Records which were made by me, they mine? And records which has made LA2QAA, they whose? :) I think, that with copyright problems cannot be basically.
I'm try to import log data from ao7 site and for a less then hour have 2006-2008 years in CSV-format.
It is not complex. But I had a second question. It is necessary for whom else, except for LA2QAA and RW3XL :)

1318. Telemetry.

Yahoo group: eu-amsat
Date: 2008-03-05 18:12:41 UTC
From: John Hackett
Topic: 1318 Message: 1318

Today I was asked how I came by the results of the TLM I posted re: LO-19.

There are two ways to translate the TLM.

1) Use Mike Rupprecht's (DK3WN) excellent software at
<http://www.dk3wn.info/software.shtml> mirrored at the LA2QAA/GM1SXX site at ...

<http://www.observations.biz/>

Or ... to make it more interesting you can do it "longhand" like this ... (see the attached pic) ... though some would say it's about as interesting as watching paint dry.

You can learn a *LOT* by monitoring 17 year old birds.

(Don't be "naughty".....GM1SXX)

Taking some of today's TLM.

0503081016Z ... (which translates to 03-March-08 at 1016 UTC) ... we get 1 control and 8 TLM channels.

LUSAT HI HI
AO AVA AB4 TDA ANV TB6 ADN AVE AE6

The channels equate to ...

0 = T
1 = A
2 = U
3 = V
4 = 4
5 = E
6 = 6
7 = B
8 = D
9 = N

...and the equations are ...

Ram (version) 0 = no errors
E " error

CH 1 = 636 divided by 131 = 4.85 volts. nominal +5v
CH 2 = 0.064 times 174 = 11.1 volts. nominal +10 battery voltage
CH 3 = 0.354 times 081 = 28.6 degrees C nominal CW transmitter temp
CH 4 = 10.9 + 180 squared divided by 40.1 = 21.36 mW nominal tx output power
CH 5 = 0.356 times 136 minus 76 = 21.36 degrees C nominal box temperature
CH 6 = 0.7 x 189 = 132.3 mA nominal +10 v current

CH 7 = 0.15 x 135 = 20.25 volts nominal +Z voltage panel
CH 8 = 0.056 times 156 = 8.3 volts nominal +8.5 voltage

Now ... if "ya'll" all have a squint at the attached pic from a "professional" TLM program you'll see that today's telemetry is correct.

(Copied "manually" by LA2QAA with the characters written three times above eachother - to stay 'awake' with 12wpm CW)

DEDEEZY! - and GM1SXX is right - (he usually is.....LA2QAA) - when he says it will be interesting to watch the TLM regarding the battery status after 17 years in space. As usual, I agree with him.

73 John. <la2qaa@...>

1319. Forgot to add the TLM pic.

Yahoo group: eu-amsat

I forgot to attach the TLM pic ... here it is.

OBS = Old, bald and senile ...

That's my excuse and I'm sticking to it.

1320. RE: [eu-amsat] Re: Good ideas for the AO-7 log.

Yahoo group: eu-amsat
Date: 2008-03-05 18:33:24 UTC
From: John Hackett
Topic: 1310 Message: 1320

Igor,
You're right of course, the actual "data" is public domain, only the site is 'copyright'.

I don't know if you're computer competent - I'm not - but Mak SV1BSX is ... though whether he has time to create a dedicated site ... or whether you want to do it ... I don't know ... so I'll throw the ball up into the air and see if anyone else is interested in creating a site where the data is "controllable" - and therefore valid and correct.

The great advantage of the current AO-7 site is the eclipse charts and the seasonal statistics - though these are now becoming misleading due to the accumulative errors.

Anybody want to stick their hand up?.

BTW ... I've been in direct contact with Alex of Amsat.ru for quite
some time now so I'm indebted to you for the introduction.
In fact, GM1SXX and myself have proposed a common project.

Subject: [eu-amsat] Re: Good ideas for the AO-7 log.

John, copyright about what??

Records which were made by me, they mine? And records which has made

LA2QAA, they whose? :) I think, that with copyright problems cannot be

basically.

I'm try to import log data from ao7 site and for a less then hour have

2006-2008 years in CSV-format.

It is not complex. But I had a second question. It is necessary for

whom else, except for LA2QAA and RW3XL :)

Igor and the group,
While I have worked from an IOTA island for the last 27 years and dome a *LOT* of portable operating I must admit I've never worked a contest or a field day so I really have no idea and cannot answer your question Igor.

However, I'm sure there are many! operators on the EU Amsat reflector who can.

The biggest *expert* I know of is Gennardy ES1RF . I'm sure he can answer anything you might wish to know on the subject Igor.

C'mon chaps ... can someone answer Igor's query please?.

Hello, John! Has read about amsat Field Day 2008 and there was a question.I'm never worked in Amsat or ARRL Field Day, but wish to work in 2008 CW/SSB/FM from constant QTH with 10 watt. I has read rules of ARRL FD to, but don't understand, how to count transmitters, in IC-820 - two, but at the same time worked one? If fixed QTH - it's D-group, but why not work with the same group station?What I should to transmit in Amsat FD 2008? :)---73! de Igor, RW3XL

Hey Bob,
Not nitpicking at all, it's an *excellent* idea and duly noted for reference for eventual changes.

As you may have picked up - Emily, holder of the copyright for the AO-7 Resource Page, disappeared down the rabbit warren of SECOND LIFE and while I'm the "official" keeper of the keys I can't impliment changes without her permission.

THIS IS WHY I KEEP BATTING ALL THESE BORING MAILS TO THE AMSAT-BB ... (there *IS* a method to the madness) ... in the hope that she might pop her head out and realise the wonderful resource the site is BUT THAT SHE NEEDS TO CONTACT LA2QAA.

I do have a couple of balls in the air with people from EU Amsat but I would much prefer to use the original.

Lets hope Emily pops up for air Bob.

Hello John
An idea I thought of for the AO7 log is you know that little magnifying glass you click on to see if there is a comment. You don't know if there is a comment unless you click it. That can mean a lot of clicking. If however say the magnifying glass looks different signifying that there is something there. I know this is nit picking, but it's just an idea. I don't envy you monitoring the comings and goings of the log. I have been on the wrong end of the stick a couple of times! I really do find it useful and a fantastic resource. I can tell who and when they have been on. From that I can at times predict who will be on the next pass. There are several regulars I enjoy chatting with. So hang in there and don't get your blood pressure up too much. Your efforts are appreciated.
73 Bob W7LRD

From: SV1BSX
Topic: 1325 Message: 1325

Hello,

Even if the announcement was for VU-52 & AO-51, today I heard it also on AO-7 "Loud & Clear" (15.06 Z, orbit #52450,
CW, +- 145.938). Just keep in mind.

73, Mak SV1BSX

==========>>>>>>>>>>>>>

Special Event Station OL30SPACE active 1 - 30th March

On 9th March OL30SPACE will be active on the VU52 and AO51 Amateur Radio satellites.

OL30SPACE will be on the air during March to commemorate 30th space flight anniversary of the cosmonaut Vladimir Remek. Vladimír Remek was the first Czechoslovak in space, and the first cosmonaut from a country other than the Soviet Union or the United states. He flew aboard Soyuz 28 from March 2nd to March10 th 1978, for seven days, 22 hours, and 17 minutes.

1327. 2 for the group.

Yahoo group: eu-amsat
Date: 2008-03-09 20:40:48 UTC
From: John Hackett
Topic: 1327 Message: 1327
Attachments: 1 described; binary payloads are missing from this source WARC

Hi All,
I am *NOT* a digital Ham - in fact, those that know me are aware that I'm THICKER than the two proverbial short planks so I hope someone with a bit more brain capacity than I have will help me.

I have two questions for the group.

Question 1.

Is there ant reason why I can't transmit a modulated carrier (FM) on the 145.900Mhz uplink of AO-16 and receive CW on the SSB/CW? downlink of 437.026Mhz ??.

Question 2.

I am 'TOTALLY' blocked by mountains re: the ISS and PCSAT and do *NOT* have 9600bps gear for AO-51 ... however, I can receive AO-16.

Can I use the UPW - (PSK modulation) - program to transmit APRS data on the uplink and will that be received on the USB downlink ?? ... and be forwarded to the internet via an APRS station ??.

I have attached the UPW file for perusal by anybody who has a few more braincells than LA2QAA and is able to advise.

(There are currently no "normal" 1200bps sats - I am trying to find a 'satellite' use for an IC-E91 D-Star transceiver ... no D-Star repeaters in Norway ... as mentioned, I'm totally blocked by mountains re: the ISS).

I would be very grateful for any advice and/or (sensible) suggestions please.

73 John. <la2qaa@amsat.org>

Technically, yes it would work. But AO-16 is currently designated for voice operations, and CW mixed in with the voice users might get you some nastygrams from the other users.

Pretty much the same answer as #1. Before the memory system crashed, you could digipeat through AO-16. Since then, we are limited to a bent-pipe setup best suited for voice. We may get to the point with IO-26 where digipeating is enabled.

You could try PCsat for 1200 baud APRS, or use MixW and your computer soundcard for 9600 baud on GO-32.

73, Drew KO4MA

1329. Very much appreciated.

Drew,
Thanks for your prompt answer to my queries.

That's precisely why I asked ... so as not get get up anyone's nose.

Actually, I can't work PSCAT or GO-32.

As I mentioned, I'm totally blocked by mountains for the ISS (so that rules out PCSAT too) at 1200bps and the IC-E91 would be impossible !! to modify for 9600bps operation, even though MixW would generate it. I believe one needs to "go in" somewhere near the varactor nodulator for 9600bps and for an IC-E91 that would entail micro-surgery ... when ICOM say "low speed digital communications" I believe they mean about 25 bps a day! into the data connector.

I find I can't get into AO-51 (portable) with low power and an Arrow aerial due to the alligators - people calling a station that is actually still speaking ... (on FM !!) ... is typical of the AO-51 operating I've been monitoring ... in other words, sending all the wrong signals to the potential newcomer.

There have been "reams" written on this subject but the age-old technique of an inadequate receive system ensures the punter turns up the wick to compensate - and cocks it up for everybody ... seems to be the order of the day on AO-51.

Thanks anyway Drew - guess I'll just have to take up stamp collecting instead.

73 John. <la2qaa@...>

1330. Grateful thanks.

Topic: 1330 Message: 1330

My grateful thanks to everyone who took the trouble to reply to my queries about AO-16.

Of course !! ... I'd forgotten for a moment that AO-16 is now an FM single-user satellite and therefore pretty useless for low power operation due to the alligators ... so I would have been totally wiped out anyway if I 'd have tried to use APRS or CW.

I'm still very grateful for the feedback though ... thank you all.

I was trying to find a "satellite" use for an IC-E91 D-Star handheld where there are no D-Star repeaters and I'm totally blocked for the ISS (1200bps packet and APRS) and when ICOM say "low speed data" on the E-91 they probably mean something like about 200 bps a day !!... (???) ...into the 'data' socket.

I SERIOUSLY !!!! doubt it's 9600bps capable ???.

I am in range of GO-32 but don't have a 9600bps capable radio.
I have MixW to generate 9600 but I believe one needs to "go in" at the varactor modulator on the transmitter and that would require micro-surgery on an IC-E91 ... even if a circuit diagram was available - which it isn't ...

... but ... there's always stamp collecting !!.

Thanks again, one and all.

You can transmit a tone or your voice, if the deviation of the signal
is not more than 3 kHz. A deviation-meter will be helpful. Or you have
to experiment with several sound-levels.

Hello again John

I was alone with OE3EV during this weekend and had a QSO with UN7RDP over AO-51! You are wondering why ? I was QRV on channel 1, 145.880 up / 435.150 down. See always the AO-51 Control Team News first on http://www.amsat.org/amsat-new/echo/CTNews.php

But you are right. The AO-51 voice repeater is a monster chaos.

RGR Thomas,
One of the reasons I've never been into AO-51 was the fact that my ancient FT-290RII won't tune to the frequencies used on the uplinks ... neither 145.920 nor 145.880.

I would have thought that the 'smarties' at Amsat would have considered that fact - obviously not ... or did they?.

Such frequency planning obviously excluded a *LOT* of potential newcomers - I wonder if it was deliberate - or just plain ignorance?.

It is 'theoretically' possible to use a 25Khz step rig by only trying to work the beginning of a pass - (5Khz up) - pre: TCA, but it's not a very good solution.

Amsat policy seems to be - new satellte - buy a new rig! - which excludes quite a lot of people ... including me.

EOW ... (end of whinging).

Thomas,
What do you know about NO-44?.

Kenneth Ransom pointed out the fact that I was confusing PCSAT (NO-44) with the old suitcase on the ISS.

He said PCSAT was workable from my QTH ... however, I see on the Amsat website that it's only semi operational for APRS.

The website for NO-44 appears to have the last entry in February 2008 and as far as I can see the satellite is only active in the mid-day sun for one pass.

Do you know if this information is correct? ... or current? ... still applies in March 10th?.

I'm trying to find a use for an Icom E91 handheld radio + Arrow antenna. As far as I understand it the 'data' connection is only for very slow data + D-Star at the same time ... so is useless for 9600bps on GO-32.

I did try to modify my old FT-290 rigs but it refused !!! to work after the modification ... he he he he.

It would be impossible to go "inside" the IC-E91 so the handheld is only good for 1200bps. As I said, I an't "see" the ISS.

There are no D-Star repeaters in Norway so it looks like I bought a "pig-in-a-poke" = useless !! piece of equipment.

No, the title is *NOT* a grammatical error, it's an exclamation of exasperation by the white rabbit in Lewis Carrol's Alice In Wonderland.

Congratulations are extended to 9M6YBG for working JH7PKU, JA1BCL, JR3KQJ and JA3DJX with the transponder OFF - (according to his report).

"Extra" points for not noticing and correcting the mistake after the first day.

Ditto to IK1RAN, also for working UT1FG with the transponder OFF ... but credit for changing it to ON and YT1FG ... even if he did leave both entries on the same pass.

Did somebody mention incorrect data would be generated?.

73 John. <la2qaa@...>

1344. ATTENTION !!! the AO-7 log 'CQ' chaps.

Yahoo group: eu-amsat
Date: 2008-03-15 08:49:07 UTC
From: John Hackett
Topic: 1344 Message: 1344

CQ does *NOT* belong in the QSO pane of the AO-7 log. That pane is for 'actual' QSO's ... 'CQ' might be valid in the COMMENTS field though I doubt if anyone is interested that somebody called CQ.

The following "instruction" is in fact on the same page as the log entry page but here seems to be difficulty with English speaking stations *NOT understanding the (quote) "If you need to change an entry you have made, click on the magnifying glass to review the record ,then click the update link (unquote).

Presumably, after several requests on the bb's for a little more dilligence in filling out the log it's quite likely that it's being done deliberately, which is about on par with the VFO swisher intelligence
(or should one say, lack of).

It has been suggested that these stations might not read the bb's ...
point taken - but surely they have eyes? ... and can read their own entries? ... (as well as the sentence at the top of the page).

There is *ALWAYS* an excuse for human error ... but the same error consistently ... well ... you know as well as everyone else ...

As I mentioned previously, regarding 'statistics' - if they're not collated correctly, the results will be incorrect ... in that case, what is the point in filling out the log in the first place ??.

Pardon me for trying to preserve a very useful resource.

73 John. <la2qaa@...>

Hi Ed,
Good idea !! ... yes it could ... but the problem is getting hold of Emily (N1DID, ex: W0EEC) who wrote the program ... I respect the copyright laws and can't change anything without her permission.

Have a good day Ed.

Hello!
Copyright for programm, but not for QSO entries, John... :)
All data is imported and ready with a blank as a divider of fields in
my flash-drive.

1347. Incorrect statistics.

Yahoo group: eu-amsat

From: John Hackett
Topic: 1345 Message: 1347

Igor ... if either you, or any one of your friends could write a similar program for AO-7 I would support and promote it.

There are a couple of other AO-7 logs doing the rounds but they can't compare.

The great advantage of Emily's pages is that it is *MORE* than a mere log, the statistical information for what is among the oldest working equipment in space (!!!) is a tremendous resource ... but unfortunately, due to accumulative errors, the statistics over time will be incorrect.

Actually, I'm rather surprised Amsat doesn't use this information more ... to it's advantage.

Countless reminders and plea's re: filling out the log have *NOT* helped. I can only assume some of it is being done deliberately - which says a *LOT* about the intelligence of people.
